Years of Faithful Service

A Proud Heritage
An Enduring Legacy

PREFACE

This is the third volume of the "Pictorial History of Kelly Air Force Base." The first edition appeared in 1985 and covered the history of the base through 1980. It brought together in print for the first time much of the rich heritage of Kelly and triggered a steady stream of additional contributions in the forms of photographs, documents, and memorabilia. They added further insight and depth to the Kelly story, resulting in the second edition in 1992, published to celebrate Kelly's 75th anniversary in 1991. This final volume updates the story to the closure of the San Antonio Air Logistics Center and the realignment of Kelly Air Force Base on July 13, 2001.

Kelly's story is an important one. To a large extent, the authors relied on the groundwork done by their predecessors in Kelly's History Office and used many of the same sources. Among the secondary works used was "Kelly Field in the Great World War," a yearbook edited by Lieutenant H. D. Kroll and published in 1919. Equally valuable were Kelly's newspapers through the years: the "Kelly Field Eagle," dating from World War I; "The Flying Times," published from 1944 through 1965 when the name changed to the "Kelly Observer," 1965 through the final edition on March 29, 2001; and finally, the web version, "Kelly Forever Times," which ran until May 29, 2001. Masters theses by William C. Boden, St Mary's University, and Frances Wyatt Isbell, Trinity University, also proved helpful, as did the autobiography of retired Brigadier General George Beverly, which offered insight into the activities of the field in the 1930s. The memoirs of Benjamin Foulois offered a useful starting point. Special mention should also be made of Lee Arbon, author of "They Also Flew," the story of sergeant pilots in the Army's air arm.

Over the past years, research by several other historians has continued to integrate new information into the existing record. Much of this work was accomplished by two reserve officers, Colonel Michael L. Lobb and Colonel Juan Montoya. They uncovered new material on Kelly's past and, in some cases, rectified errors in the historical record. Information collected from other sources, particularly the National Archives, yielded such treasures as the diary of the 3d Aero Squadron, which opened Kelly Field in 1917. Most of the research, however, was in the archive collection of the Office of History, including the annual histories produced since 1942. These works and the rest of the Kelly Air Force Base archives now reside in the History Office of the 37th Training Wing at Lackland Air Force Base.

Contributors to this volume include every historian who served at Kelly, but the authors of this work were primarily Ms Ann Krueger Hussey, who wrote chapters five, seven, nine, and ten; Dr Robert S. Browning, who penned chapters one through four, six, and eight; and Mr Ross Day, who contributed to chapters nine and ten. Technical Sergeant Michael J. Obert wrote several of the sidebars, and Technical Sergeant Guy Harper answered questions and assisted in collecting photographs. Ms Elizabeth Manning laid out the first eight chapters of this history. Ms Pat Parrish had the equally arduous task of editing and arranging the text and photographs in the last two chapters, while ensuring the 1992 edition and the new information added in this volume meshed seamlessly together. The skill and talent of these two women made this history the eye-catching work it is. Special thanks go to the Kelly Field Heritage Foundation for subsidizing the production of this final version of the pictorial history. For all of us, it was a labor of affection, and we are grateful to everyone who contributed their time, knowledge, insight, and humor. By allowing us to capture something of the spirit of Kelly's past, their generosity has made this volume far better than it otherwise would have been. Any errors of fact or interpretation belong to the authors alone.

Ann Krueger Hussey
Former Chief, Office of History and
Historian, Kelly Field Heritage Foundation

PROLOGUE

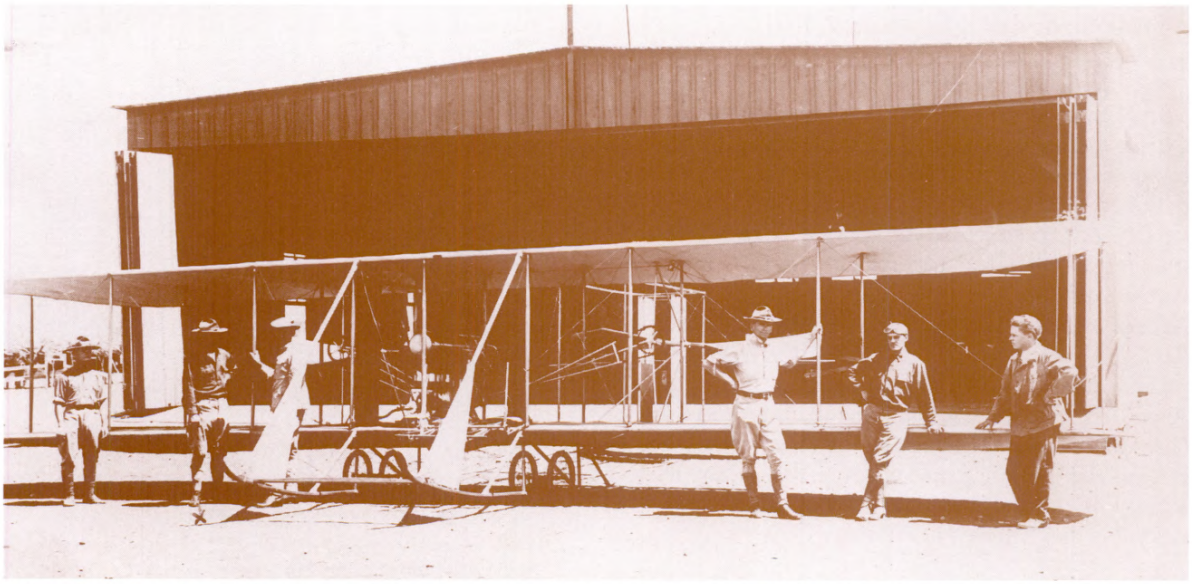

INTO THE AIR

Military Aviation in San Antonio, 1910-1915

At Kitty Hawk, North Carolina, the morning of December 17, 1903, was cold and windy. With the assistance of four men from a nearby United States (U.S.) Lifesaving Station, two brothers from Dayton, Ohio, maneuvered an ungainly contraption from its shed, mounted it atop a rail, and started its small engine. "After running the engine and propellers a few minutes," recorded Orville Wright, "I got on the machine at 10:35 for the first trial." At his signal, the men loosened the rope holding the machine and it started off down the rail, gathering speed and then lifting into the air. The flight was brief, lasting only about twelve seconds and covering only 100 feet, but it represented the first time a man-made, heavier-than-air machine had flown under its own power. Although in four attempts that day--the longest flight was barely over 850 feet and lasted less than a minute--Wilbur and Orville Wright had realized the centuries of old dream of manned flight, opening a new era in history.

Recognition of the Wrights achievement was slow. Their claims were met with skepticism, disbelief, and even disinterest. During 1904 and 1905, the Wrights continued to improve their aircraft, twice offering it to the U.S. Army. However, the Board of Ordnance and Fortification refused to specify the requirements for a flying machine until President Theodore Roosevelt intervened and ordered Secretary of War William Howard Taft to investigate the potential of such a machine. In late December 1907, the War Department called for bids on an aircraft that would carry two people at forty miles-per-hour for a distance of 125 miles. The Wrights offered to build such an aircraft for $25,000. In August 1908, they arrived at Fort Myer, Virginia, with the plane for a series of preacceptance tests.

The test flights began on September 3, 1908, thrilling local spectators. But on September 17 the plane crashed, injuring Orville Wright and killing his passenger, Lieutenant Thomas E. Selfridge. The

Aviation in San Antonio began with the arrival of a Wright Type-B airplane at Fort Sam Houston in 1910. Shown with the Army's third airplane are (left to right); Cpl. Vernon Burge, Pvt. Kenneth L. Kintsel, Sgt. Herbert Marcuse, 1st Lt. Benjamin Foulois, and Oliver G. Simmons (civilian mechanic).

Facing Page: Benjamin D. Foulois

One of the earliest flying schools was established by aviation pioneer Glenn H. Curtiss at North Island, San Diego, California. Shown are students (left to right) George E.M. Kelly, Paul W. Beck, Curtiss, Charles J. Witmer, John C. Walker, and Theodore G. Ellyson.

Wrights were unable to return to Fort Myer until June 1909. On July 27, Orville Wright, now recovered from his injuries, took Lieutenant Frank P. Lahm as a passenger on the first official test flight. Three days later, with Lieutenant Benjamin D. Foulois as a passenger, Orville flew five miles to Alexandria, Virginia, averaging 42.5 miles-per-hour. The Army accepted the plane, which became Aeroplane Number 1, on August 2, 1909.

As part of the original contract, the Wrights agreed to train two Army pilots to fly Number 1. During October, Wilbur trained Lieutenants Frank Lahm and Frederic E. Humphreys, both on detached duty from their regular branch. Both officers soloed on October 26. Lieutenant Foulois received some training, too, but had not soloed when Lahm and Humphreys crashed Number 1 in November. Neither was seriously hurt, but the plane was badly damaged, and both officers soon returned to their regular duties. As the plane underwent repair, the Army decided to relocate its flying center to Fort Sam Houston, Texas. Although he had not yet soloed, Foulois was the only Army officer on flying duty. He, a party of enlisted men, and Aeroplane Number 1 arrived in San Antonio in February 1910.

During February, Foulois and his men erected a small hangar on the mounted drill field at Fort Sam Houston and rebuilt the plane. On March 2, 1910, Foulois climbed aboard for what he recalled as "my first solo, landing, takeoff, and crash." This first flight of a military aircraft in Texas ended when a fuel pipe cracked, and Foulois was forced to make an emergency landing, damaging Number 1 enough to require a week of repairs. Ten days later, during the last of five flights, Foulois was nearly thrown out of the aircraft by a violent gust of wind. The next day he went to the saddlery shop of a nearby field artillery

Four years after flying was banned at Fort Sam Houston, Lieutenant Foulois brought his wandering band of aviationists back to San Antonio. Shown with Lieutenant Foulois (center) are Sgt. Vernon Burge (left) and Sgt. S.J. Idzorek. Idzorek was later commissioned and put in charge of the Mechanics School at Kelly Field.

unit and obtained a saddle strap which became the first Army aircraft seatbelt. Foulois carried on a steady correspondence with the Wright brothers, describing his actions and the resulting behavior of the aircraft. "I was the first, and only, pilot," he later recalled, "to learn to fly by mail." Foulois also installed wheels on Number 1, ending reliance on the cumbersome track arrangement used by the Wrights.

During the summer of 1910, Foulois and his small crew installed an electronic buzzer system on the Army's target range at Leon Springs, completed installation of their self-designed undercarriage, and continued their practice flying. In March 1911, a reluctant Congress appropriated $125,000 for Army aeronautics, and Major General James Allen, Chief of the Signal Corps, ordered five new planes.

In the meantime, Foulois happily experimented with a Wright Type B aircraft loaned to the Army by millionaire publisher Robert Collier. Number 1 was retired before being restored to its original condition and turned over to the Smithsonian. Accompanied by pilot Philip Parmalee, a civilian employee of the Wrights, Foulois traveled to the border to participate in maneuvers. On a flight from Eagle Pass, Texas, back to Laredo, Parmalee accidentally shut off the engine and the plane glided to a rough crash landing in the Rio Grande. Both men emerged unhurt, but the Collier-owned airplane had to return to Fort Sam Houston in a wagon.

During the same period, pioneer aircraft designer Glenn Curtiss opened a flying school on North Island, California, just outside San Diego and invited

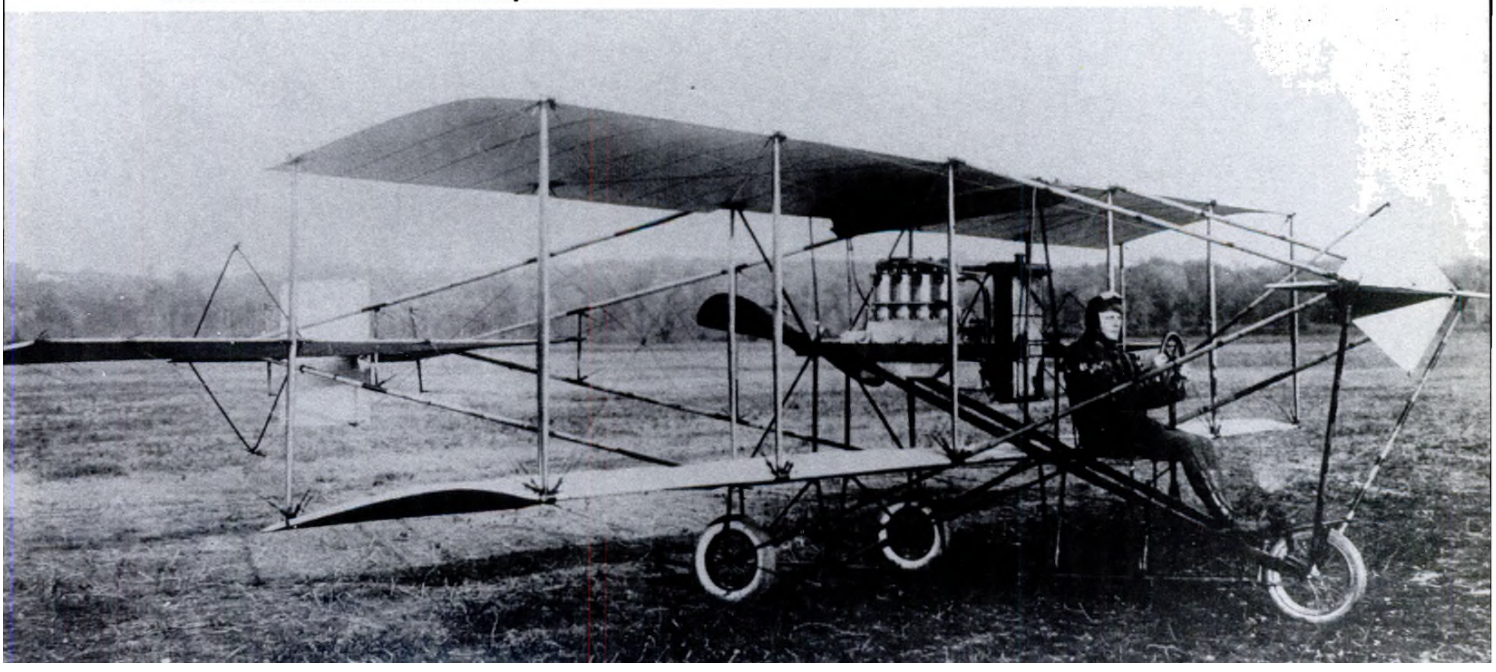

Foulois over the Fort Sam Houston drill field in 1910.

all interested military officers to take free flying lessons at the school. Three Army officers, Lieutenants Paul W. Beck, John C. Walker, and George E. M. Kelly were assigned to the school. After a few hours of basic instruction at the Curtiss school, all three joined Foulois in San Antonio in April 1911. Their arrival coincided with the arrival of two civilian pilots--Frank T. Coffyn from the Wright factory and Eugene Ely from Curtiss--and two new aircraft, a Wright Type B "Flyer" similar to the Collier machine and a Curtiss D "Pusher."

Lieutenant Foulois believed that none of the three Army officers was completely ready to fly on his own.

A similar Curtiss Type-D pusher would crash at Fort Sam Houston on 10 May 1911. Lieutenant George E. M. Kelly would become San Antonio's first air fatality.

Since the Curtiss plane did not have dual controls, the young pilots had to teach themselves to fly, making many of the same mistakes made by Foulois in his own self-guided training program. Moreover, the control systems for the Wright and Curtiss machines were entirely different. The throttle of the Wright plane, for example, was a foot pedal that worked to vary the magneto spark firing the cylinders of the engine. Pressing the pedal actually slowed the spark, and the aircraft's speed. The Curtiss throttle was also a foot pedal, but it worked exactly opposite to the Wright system, with increased pedal pressure resulting in greater speed. Such distinctly different systems made it difficult to shift from aircraft to aircraft, especially for inexperienced pilots.

Ely and Coffyn began a series of flights in late April, with Coffyn taking Foulois up in the Wright to correct some remaining flaws in Foulois' landing technique. At the end of the month, Coffyn and Ely also began offering instruction to some eighteen young Army officers stationed at the post--including Lieutenants Horace E. Hickam and Leighton B. Hazelhurst, both of whom would have airfields named for them.

Up to this point, the activities of the small aeronautical group had been remarkably accident free, but their luck now began to run out. On May 2, Lieutenant Walker narrowly avoided a crash in the Curtiss D aircraft. Within days, Walker asked to be relieved from aviation duty. A day after Walker's near-calamity, Beck suffered an engine failure in the same Curtiss machine and crash-landed in the chaparral. Beck survived, although he was badly shaken up. This time the aircraft was severely damaged, and Curtiss mechanics spent a week repairing it.

On May 10, 1911, Lieutenant Kelly took the Curtiss aircraft up for his first qualification flight. After taking Lieutenant Hickam for a brief instruction flight, Frank Coffyn was preparing to takeoff with Lieutenant Hazelhurst as a passenger, but waited while Kelly took off, made a brief circuit of the parade ground and came into land. Kelly was the least experienced of the three new Army pilots, and he came in too fast and at too steep an angle during his first landing attempt. After bouncing into the air again, Kelly tried a second time. This time he cut his engine power, but again he dove too steeply toward the ground. The aircraft struck nosewheel first, smashing the new front steering fork and rebounding briefly into the air. Seemingly headed toward a group of

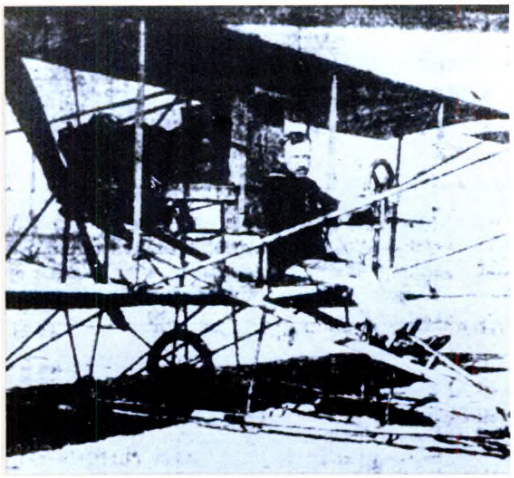

Ellyson-Beck-Curtiss-Kelly-Walker

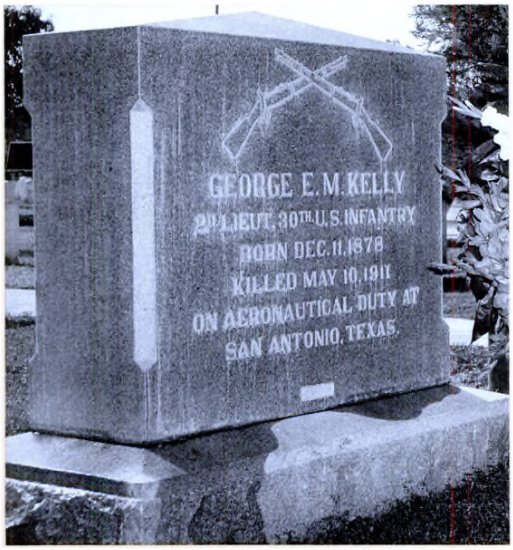

nearby tents, Kelly banked steeply in an apparent attempt to avoid them. He was too low. His wing dug into the ground, and the aircraft cartwheeled across the field in a flurry of broken wood and torn cloth. Thrown out as the plane crashed, Kelly died two hours later from a fractured skull.

Lieutenant Kelly was the first Army pilot to die while piloting an Army aircraft, and Foulois bitterly blamed Lieutenant Beck for not properly overseeing the repair of the Curtiss plane. A special board of officers was kinder, blaming a combination of pilot error and "an abrupt depression in the ground or some obstacle" for the tragedy.

The crash also had great impact on Major General William H. Carter, Commander of Fort Sam Houston, and already on record as declaring that airplanes were of no use to the Army. General Carter immediately prohibited further flying at his post. The month-old Provisional Aero Company disbanded, with all personnel and equipment returning to College Park, Maryland, under Beck's command. Lieutenant Foulois, the most experienced pilot in the Army, went to a desk job with the Militia Bureau of the War Department. Military aviation would not return to San Antonio until 1915.

English-born Lieutenant Kelly seated at the controls of a Curtiss Type D Pusher, the same type in which he met his untimely death. Unlike the Wright aircraft, the Curtiss plane was a single-seater, which meant that every flight was a solo flight.

Lieutenant George Edward Maurice Kelly was the first Army pilot to die while piloting an Army plane. His pioneering spirit remains alive at Kelly Air Force Base, a prime contributor to the Nation's defense.

George Edward Maurice Kelly

George Edward Maurice Kelly was born in London, England, on December 14, 1878. Educated at private schools, he emigrated to the United States in August 1896. For two years he lived in Great Falls, Montana, with two uncles, gaining some experience with machinery. When the Boer War broke out in 1899, Kelly attempted to enlist in the Canadian Mounted Rifles, but was rejected due to his light weight.

Kelly became a naturalized United States citizen in 1902. A year later, on a visit to New York City, he learned that he might be able to gain a commission in the United States Army from the enlisted ranks. In January 1904, Kelly signed up with the 84th Company of the Coast Artillery Corps. In February 1907, Quartermaster Sergeant Kelly got his commission as a 2nd Lieutenant in the 30th Regiment of Infantry.

Lieutenant Kelly's first service was in the Philippines. On his return, he visited China and saw relatives in England. Back in the United States in December 1909, Kelly was on duty at an aviation meet when he got the chance to make a balloon ascent. Benjamin Foulois was bitten by the aviation bug when he served with balloons, and this brief exposure apparently had the same effect on Kelly. By early 1911, he had obtained War Department approval to train at the Glenn Curtiss school at North Island, California.

Kelly did not stay long at North Island. By the end of April 1911, he had joined Foulois and several other fellow aviators at Fort Sam Houston. Less than two weeks later came his fatal crash.

Kelly was buried on May 15, 1911. An impressive procession traveled down New Braunfels Avenue from Fort Sam Houston to the National Cemetery. There Kelly was laid to rest with full military honors. His honorary pallbearers included his fellow pilots, Olin Ellis and Frederick Test. Active pallbearers came from among the enlisted men who served as mechanics, and included both Stephen Idzorek and Herbert Marcuse.

米9422

CHAPTER ONE

THE CRADLE OF THE AIR SERVICE

On November 4, 1916, Major Benjamin D. Foulois returned once again to San Antonio. He was acting in response to verbal orders from the Chief of the Aviation Section of the Signal Corps, Colonel George Squier, to find a site for a new flying field.

American Military Aviation, 1911-1917

The progress of Army aviation had been uneven in the five years since the transfer of Foulois and his small provisional squadron from Fort Sam Houston. A trickle of funds ensured that a small, but eager, number of young officers had access to flying training during 1912-1913. At the end of February 1913, the Army ordered the majority of available pilots to Texas City, Texas, under the command of Captain Charles DeForest Chandler. There they formed the 1st Aero Squadron. American relations with Mexico were tense in the aftermath of a revolution in which General Victoriano Huerta overthrew, and assassinated, Mexican President Francisco I. Madero. Huerta's opponents, including a one-time bandit named Francisco (Pancho) Villa, continued to fight with arms that often came from the United States. Angered by this, and by the refusal of the American government to recognize his regime, Huerta issued numerous threats, leading to an American military buildup along the border. The mission of the 1st Aero Squadron was to cooperate with the Army's 2nd Division. Fortunately, tensions eased in the early summer. Since the weather at Texas City was not conducive to regular flying, most of the men and planes moved to the small aviation school at North Island outside San Diego, California. Facilities there were better, but morale among the small group of aviators was often low, largely because they lacked a clearly defined status within the Army's organization. That issue was partially rectified when Congress created the Aviation Section of the Signal Corps in July 1914, with an authorized strength of sixty officers and 260 enlisted men. In addition, Congress authorized flight pay and established the official ratings of Junior Military Aviator (JMA) and Military Aviator.

Benjamin D. Foulois

Benjamin "Benny" D. Foulois was born in December 1879. At the age of 19 he enlisted in the United States Army as an engineer. In 1908, Foulois was assigned to the Office of the Chief Signal Officer. While assigned to this position, he operated the first dirigible balloon purchased by the government and was also one of the first U.S. Army officers to learn to fly.

In June 1910, he moved to Fort Sam Houston in San Antonio, Texas, with the sole airplane owned and used by the Army. At this point, Benny was the Army's only pilot, observer, navigator, instructor, and student.

During World War I, Foulois was named Chief of Air Service for the American Expeditionary Force (AEF) in France. During 1918, he served as Chief of the Air Service for the First Army; Assistant Chief of the Air Service, Zone of the Advanced AEF; and Assistant Chief of Air Service for the Services of Supply.

Foulois became Assistant to the Chief of the Air Corps in 1927. In June 1929, he went to Wilbur Wright Field, Ohio, as the Chief of the Materiel Division. He commanded the Air Corps Exercises of 1931, which earned him the Mackay Trophy. In December of the same year, he was promoted to the rank of major general and named the Chief of the Air Corps.

He retired in December 1935 after a long and distinguished career. In 1963,, Benjamin D. Foulois was the sixth person inducted into the National Aviation Hall of Fame, joining the likes of his mentor, Wilbur Wright.

In September 1914, Foulois took command of the 1st Aero Squadron, which moved from North Island to Fort Sill, Oklahoma, in July 1915. In November, the squadron completed its first major cross-country flight (although not non-stop) from Fort Sill to Fort Sam Houston. For a second time military aviation was present in San Antonio, but again its stay was brief. In March 1916, Pancho Villa raided the town of Columbus, New Mexico. In angry response, President Woodrow Wilson ordered Brigadier General John J. Pershing to lead a "Punitive Expedition" into Mexico to capture Villa. The 1st Aero Squadron left San Antonio for Columbus immediately to operate in conjunction with Pershing's troops.

The experience of the 1st Aero Squadron with Pershing's expedition was the first major field test for American military aviation, and it was soon clear that in terms of both numbers and equipment the squadron was utterly inadequate. The underpowered JN-2 aircraft could not clear the mountains of northern Mexico and had great difficulty in the winds at lower altitudes. Within a month only two planes were operational, and both were returned to Columbus, condemned, and destroyed. With World War I raging in Europe, and all the combatant powers fielding ever larger numbers of steadily improving aircraft, it was obvious that steps had to be taken to improve and expand American military aviation. In August 1916, Congress appropriated the unheard of sum of $13 million for aeronautics. In September, Foulois went to Washington to assist in aviation section planning, which focused on the creation of five aero squadrons in addition to the 1st (at Columbus, New Mexico) and the embryonic 2nd (at company strength in the Philippines); expansion of training facilities; and the acquisition of more advanced aircraft. Ordered to find a suitable location for at least two of the proposed squadrons and a training facility, Foulois could not envision it being "anywhere else but in San Antonio."

Men of the 1st Aero Squadron on the Mexican Border. Captain Benjamin Foulois is seated on running board.

Temporary barracks housed troops active in the construction of Camp Kelly.

Choosing the Site

Almost immediately after arriving in San Antonio, Foulois recognized that the former Remount Depot at Fort Sam Houston, the existing flying field at the post, was far too small to accommodate two squadrons equipped with more powerful aircraft. Within days he was searching for alternative locations with the enthusiastic support of the local Chamber of Commerce.

Nine days after Foulois arrived in the city, Brigadier General George P. Scriven, Chief of the Signal Corps, visited San Antonio while enroute to an inspection tour of the border units. Feted by the Chamber of Commerce, he and Foulois visited several of the prospective sites for the new post. The most attractive of these was a 700-acre tract about seven miles south of the city adjacent to the tracks of the Missouri-Pacific Railroad. In addition to the rail lines, which would simplify the shipment of material to the new post, the site Foulois favored was relatively flat, open farmland, with an artesian well to supply water. On November 21, 1916, Scriven passed back through San Antonio on his return from the border, examined the site, and gave Foulois instructions to proceed with the acquisition of leases for the land. By December 13, Foulois had the necessary lease agreements; and Senator Morris Sheppard of Texas was leading the effort to provide funds for the rental, and ultimate purchase, of the land.

Although construction on the new post awaited passage of the Sheppard Bill, War Department officials authorized leasing the land on January 11, 1917, and authorized a payment of $11,924.26 for a one-year lease on January 20. By this time personnel of the newly-formed 3rd Aero Squadron were already

Tent hangars sheltered Curtiss JN-4 "Jennies" during the first few months at Camp Kelly.

gathering at Fort Sam Houston under the command of Captain Thomas S. Bowen. On February 27, Foulois, already preparing to return to Washington, advertised for bids to clear and grub the land "between the Frio City Road and the GH & SA Railroad right of way, and from the large artesian well in the north end of the tract to Leon Creek." Mr. Ernest Koerner won the contract on March 10. Details from the 3rd Aero Squadron augmented his hired laborers in clearing and grubbing the land. Eight privates, one noncommissioned officer, and a cook were stationed permanently at the site in March to guard lumber piles and supplies, marking the first military occupation of the field.

Koerner also won the contract to build the first permanent buildings on the field. Years later, engineer George A. Williams recalled that in March 1917 he was "on my uppers" when he decided to pay a visit to his old college friend, Captain Townsend F. Dodd, at Fort Sam Houston. Dodd was in the process of taking over from Foulois as Aviation Officer for the Southern Department, and they were both present when Williams paid his visit. After Williams made his pitch for a job, Dodd and Foulois conferred briefly, and Dodd told Williams to return on Saturday. When Williams came back, he, Dodd, Foulois, and an unnamed quartermaster colonel drove out to the site. Williams recalled the quartermaster officer as saying, "Perhaps I am stretching my authority, but...go ahead." Dodd then handed Williams the plans for six concrete and steel hangars, and Williams began laying the foundations on March 27. Koerner had the contract to build the hangars, said Williams, "and I supervised their erection."

Few Americans had experience in building hangars in 1917, but Koerner was one of those few. In August 1915, he built two hangars at the Aviation Post at Fort Sam Houston as part of the preparations made in anticipation of the arrival of the 1st Aero Squadron from Fort Sill, Oklahoma.

Constructed of galvanized iron on a steel framework, these first hangars were actually modified railroad siding buildings with one eave of the steeply pitched roof much longer than the other. At the new field, Koerner simply placed two of these structures back-to-back to form each hangar, giving the roof line a unique sawtooth appearance still partially visible on a remaining building over seventy years later.

Soon after Camp Kelly was established, airplanes began arriving by rail.

Opening the New Field

On April 5, 1917, with construction still underway, four JN-4 "Jennies" landed on the rough, dusty field. The pilots of the first four aircraft to use the new field included Captains George Reinburg and Bert Atkinson, recent arrivals from the 1st Aero Squadron, and Captain Carl Spaatz, whose name was consistently rendered as "Spotts" by the local press. Also piloting a plane that afternoon was Eddie Stinson of San Antonio, a civilian flying instructor whose sisters were the nationally known aviatrixes Marjorie and Katherine Stinson. Koerner's iron and steel hangars were still unfinished, and according to a popular legend, the flyers slept that night underneath the wings of their planes. The more prosaic truth is that the planes were housed in tent hangars, familiar to the pilots along the border, while the men were also quartered in tents. The following day the United States entered World War I.

Within days the new airfield was one of the busiest in the country. By the middle of May over 4,400 men were crowded onto the field. With the construction of wooden barracks and mess halls unable to keep pace with this growth, most of these men lived in ordered rows of pyramid-shaped tents, the number of which grew daily. Along with the 3rd Aero Squadron under Captain Thomas S. Bowen, the 4th Aero Squadron, commanded by Captain Bert Atkinson, and the 5th Aero Squadron, under Captain Carl Spaatz, the field was occupied by the Provisional

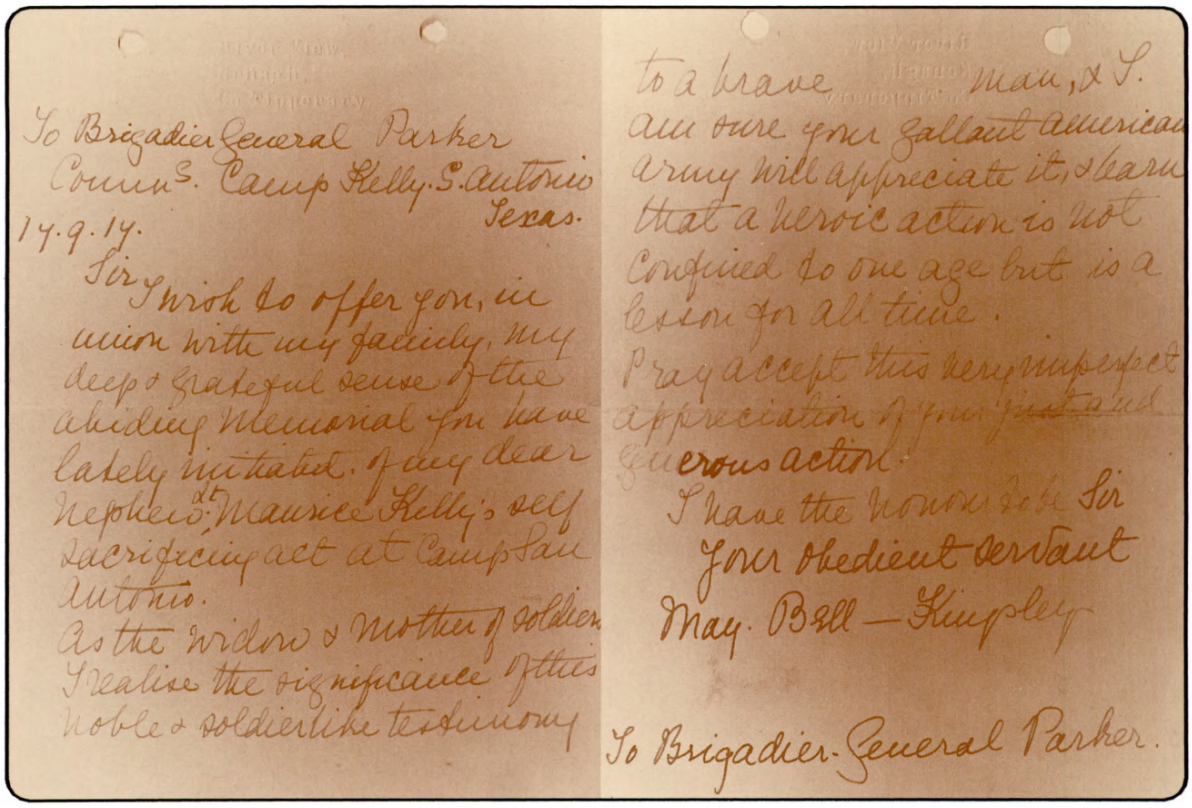

Troops began arriving by the thousands almost immediately.

Captain Thomas South Bowen

Thomas South Bowen graduated from the United States Military Academy at West Point in 1909. He commanded Company "B" of the 1st Aero Squadron at North Island near San Diego during 1914-1915 and continued in that capacity when the 1st Aero Squadron deployed to Fort Sill, Oklahoma, in the summer of 1915. He was one of the pilots on the historic flight of the 1st Aero Squadron from Fort Sill to Fort Sam Houston, Texas, on November 22, 1915. Bowen deployed with the squadron to the Mexican border for service with the Mexican Punitive Expedition. He returned to San Antonio with Major Benjamin Foulois in November to help organize the 3rd Aero Squadron. Under Bowen's command, the new squadron was the first to occupy Kelly Field in the spring of 1917.

To Brigadier General Parker
Comm^g. Camp Kelly. S. Antonio
Texas.
14.9.14.

Sir I wish to offer you, in union with my family, my deep & grateful sense of the abiding Memorial you have lately initiated of my dear Nephew Lt. Maurice Kelly's self sacrificing act at Camp San Antonio.
As the Widow & Mother of soldiers I realise the significance of this noble & soldierlike testimony to a brave man, & I am sure your gallant American army will appreciate it, & learn that a heroic action is not confined to one age but is a lesson for all time.
Pray accept this very imperfect appreciation of your just & generous action.
I have the honour to be Sir
Your obedient servant
May. Bell — Kingsley

To Brigadier-General Parker.

Aviation Squadron, which acted as a reception center for the torrent of recruits. In June, when Lieutenant Colonel Charles E. Tayman arrived to take command, he discovered that he had only twenty-five officers and a handful of noncommissioned officers to assist him in organizing and controlling over 5,700 men.

One of Colonel Tayman's first steps was to name the new field. At his suggestion, on June 11, Brigadier General James Parker, Commander of the Southern Department, issued General Order Number 32, officially designating the "Aviation Camp, about five miles south of San Antonio...'Camp Kelly' in honor of Second Lieutenant George E. M. Kelly, 30th Infantry." Just over six weeks later, General Order Number 49 renamed the installation Kelly Field. Kelly's family in Ireland was deeply appreciative of this gesture by the U.S. Army. Kelly's aunt, May Bell-Kingsley, wrote a brief note to General Parker in September thanking him for the "noble and soldier-like testimony to a brave man."

Of more immediate concern was the decision of the Southern Department to further expand the training function at Kelly Field. In June, the Army directed the field to form an additional twenty-seven aero squadrons and announced plans to establish a supply depot and four more training camps in the San Antonio area. Although the Army intended to create other training centers at Fort Worth, Dallas, and Wichita Falls, Texas, Kelly Field was clearly intended to be the largest and most important aviation training facility in the country. Not only would this mean a further influx of recruits, it also forced officials in both San Antonio and Washington to recognize that the original site chosen by Foulois only seven months earlier was already too small.

Growth and Expansion

Local military officials immediately enlisted the San Antonio Chamber of Commerce in the quest for additional land. Anticipating the need for expansion, Major Townsend Dodd had obtained lease-options on approximately 1,800 acres of land adjacent to the north side of the original site. A committee of the Chamber of Commerce took the necessary steps to negotiate lease agreements more acceptable to

government attorneys, determining fair rental values and persuading local landowners to yield to the terms. In mid-July 1917, the government agreed to the terms, and construction on this new portion of the field began on July 24.

The owner of one 200-acre tract was Emmett B. Cocke of San Antonio, who was amazed at the speed at which the contractors went to work. Briefly out of town for five days, he returned to find his tenants moved off the land, a large portion of the current cotton crop already chopped down, a small railroad spur laid from the main line to the artesian well, a barn cut in half, and one tenant cottage converted into a construction crew headquarters and drafting room. Government agents paid tenants a total of $1,700 for their crops and brought in 500 laborers to cut mesquite, level roadbeds for railroad tracks, and begin construction of foundations for the barracks and hangars at the field. Many people might be upset over the sudden loss of their land, but even years later Mr. Cocke saw it as "a blessing" that he was able to help in the emergency.

The newly acquired land north of the original site was soon unofficially known as Kelly Number 2, with the site first chosen by Foulois called Kelly Number 1. Kelly Number 2 was, in fact, designed from the beginning to accommodate double the number of hangars of a normal field. For a time portions of it, particularly an area of open fields adjacent to the north, were called Kelly Number 3, although this terminology disappeared during the war. In addition, the Air Service constructed three more fields around San Antonio, initially numbering each under the name Kelly Field and posing numerous difficulties for future historians. Kelly Number 4 was essentially an open field whose exact location has never been determined. Based on distances mentioned in old news articles and reminiscences, it was apparently several miles north-northwest of the main field, near the junction of today's Military Drive and Potranco Road. Kelly Number 6 was also a small auxiliary field with rudimentary refueling facilities and no permanent buildings. It was apparently located about two or three miles southeast of the main field, probably just north of the site of Palo Alto College. Kelly Number 5 had only a brief existence as one of the numbered fields before being renamed Brooks Field in February 1918. Cadet Sidney J. Brooks of San Antonio was the first fatal casualty at Kelly, crashing on November 13, 1917. After naming Brooks Field in his honor, the Air Service promptly leased the airfield owned by the Stinson family and began calling it Kelly Number 5. This rapid proliferation of numbers not only remains confusing today, but it simply reflects the near chaotic changes taking place throughout the American military as it geared up for war.

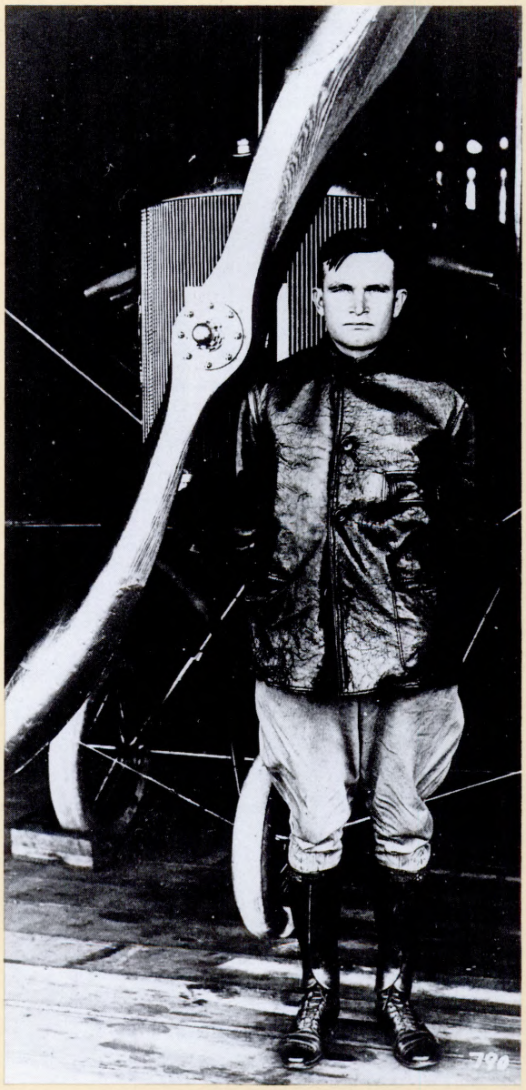

Sam Evers, aboard his Alice Chalmers tractor, levels the air strip at Kelly Field Number 2. In 1917, Evers was paid $25 a day for each of the five tractors he used in the construction.

Standardizing Air Field Construction

In the spring of 1917, Colonel C. G. Edgar of the Aviation Section Construction Division, visited Camp Borden, Ontario, a Canadian flying field. Through his "old boy" connections, he obtained copies of the plans for the camp from an old friend, Oscar Filley, and hired noted Detroit architect Alfred Kahn to redraft these plans. Using Kahn's designs, Edgar then hired Stone and Webster to build twenty-four flying fields throughout the United States--including Kelly Number 2--each one a duplicate of the fifty-four wooden buildings at Camp Borden. According to Kahn's design, each field had twelve wooden hangars with flattened gambrel roofs and sliding doors hanging on a monorail at each end. Kelly Number 2 was a "two field" unit and thus had twice the number of hangars and support buildings. Hangar Number 9 at Brooks Air Force Base, Texas, is an existing example of an Edgar-built World War I style hangar.

The contractor for the construction of facilities on Kelly Number 2 was Stone and Webster, a Massachusetts firm. Under the supervision of War Department representative Lieutenant E. L. Deacon, this company would eventually erect over 100 buildings on the field, including twenty-four hangars, twelve large barracks, officers' quarters, mess halls, repair shops, garages, and administrative buildings. This long array of buildings ran a mile-and-a-half east to west along a road from the site of today's operations hangar to the current location of the Texas Air National Guard facilities. Up to 6,000 men were at work on the field, with as many as fifty men or more at work on any single building; workers labored seven days a week. Government purchasing agents bought most of the necessary supplies locally, and when material was unavailable in San Antonio, every effort was made to obtain supplies from other sources in Texas. Lumber, for example, came from mills in East Texas, supplied under the direction of the Southern Yellow Pine Emergency Bureau, a wartime agency established to coordinate distribution of the pine lumber cut by mills throughout the South.

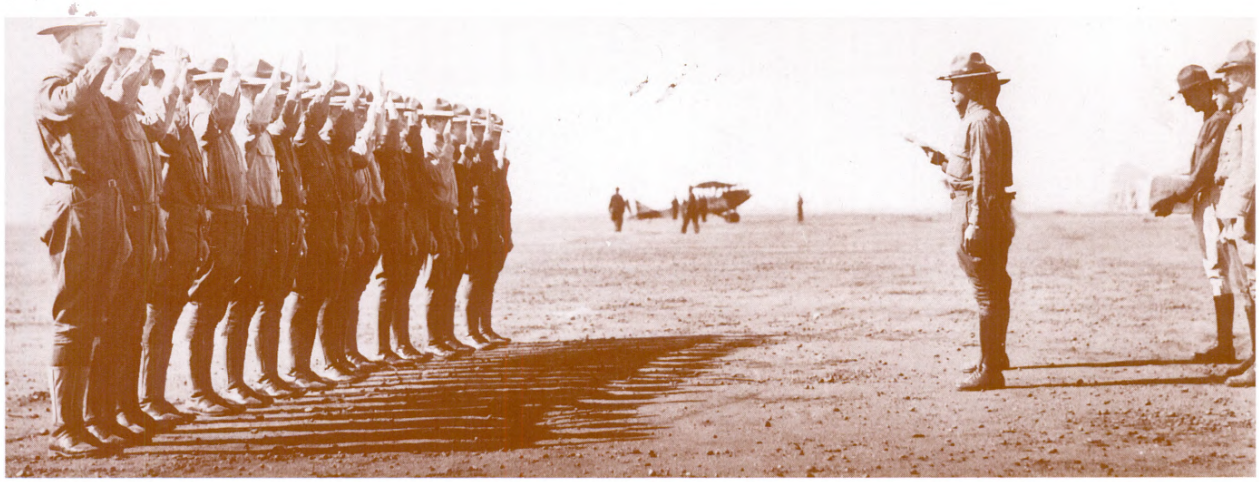

Stone and Webster turned the newly constructed facilities over to the Air Service officially on October 1, 1917, but by that time the field was already in use. With twenty-four large hangars and three large buildings for classrooms, Kelly Number 2 could accommodate 500 flying students, up to seventy-five instructors, and over 200 planes. Almost immediately, Kelly Number 2 became the center for flying instruction, and the hangars and shops at Kelly Number 1 became almost entirely repair and maintenance facilities. In addition, Kelly Number 1 remained the home of the reception and training center, creating a dichotomy of functions on Kelly Field that would profoundly shape future activity at the field.

Captain Seth Cook was commander of the new field when the first flying cadets arrived.

The Recruit Brigades

By the fall of 1917, the Provisional Aviation School Squadron officially was known as the Recruit Camp.

By 1917, aerial warfare was a fact of life in Europe. Recruits were given primary aviation training at Kelly Field, with further refinement of their skills given at aerodromes in France.

On October 1, 1917, it was again renamed, this time being called the 1st Training Brigade, commanded by Major A. W. Barry. From the beginning, however, it served as the first military home for the thousands of recruits coming into the Air Service. During the first two months of operations at Kelly Field, most training involved fatigue work. The new recruits were forced to help build their own quarters and assist hired laborers in clearing and leveling the flying field. From early June, with the arrival of Colonel Tayman, some order began to emerge from the chaos of hurried expansion. Under Captain John P. Edgerly, a former Navy officer, men of what would be later called the 84th Aero Squadron began testing and classifying recruits by skill, assigning them to various aero squadrons on the basis of this testing. Once a new aero squadron reached a total of 154 men, it was ready for transfer to a new location for final training, with the first of these squadrons leaving in August. By October of 1917, with the operations of the Training Brigade now going more smoothly, Kelly Field had formed and transferred eighty squadrons to other locations, with another fifty squadrons leaving Kelly in November alone.

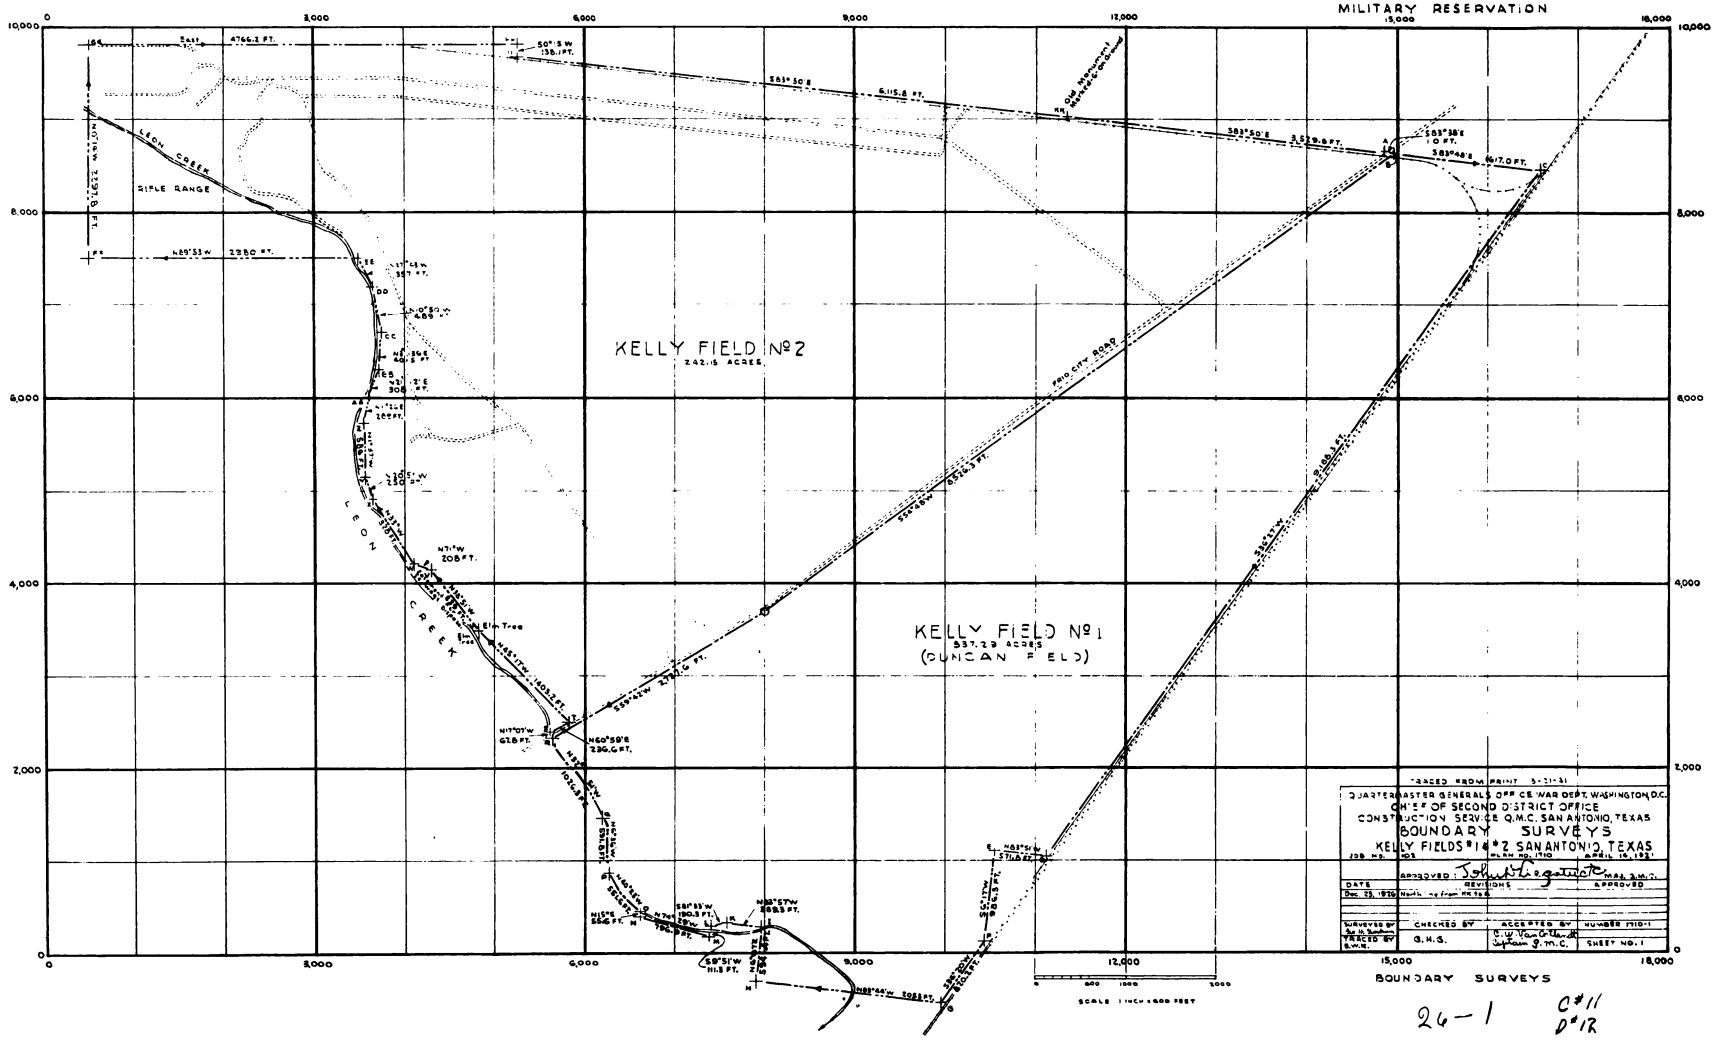

This flood of men was beyond the capacity of the 1st Training Brigade, and in December a 2nd Training Brigade was formed, followed eventually by a 3rd Training Brigade in May 1918. On Christmas Day 1917, despite the number of squadrons leaving for other locations, just under 39,000 men were crammed onto the field. By this time Kelly served as the clearing house for all the other aviation training fields, with six squadrons leaving each day, most to form the initial cadre at other training fields. Over 15,000 enlisted men shipped out in January, but another 45,774 recruits arrived to replace them. Only the arrival of 750 newly minted officers from the Army training center at Leon Springs averted a potential crisis in providing supervision for this number of men.

Camp Life at Kelly Field

The confusion at Kelly Field during the first harried months of Air Service expansion was similar to that at camps all across the country. Nevertheless, for the thousands of young men who arrived during those early days, the experience was a shock. "Do you remember," rhetorically asked one of the writers of a Kelly Field wartime yearbook, "arriving at Kelly Field after withstanding a long, hard trip, when food had given out 36 hours early, with great anticipation of becoming a great aviator and of making fame by bombing old Hun "Bill's" palace--finding yourself lined up in front of a row of tents, your feet in black mud and the wind blowing a gale, trying to obey the orders--'prepare for inspection'?" For much of the first few months, the entire field was covered constantly in blowing dust. For some time food was cooked in the open, and the unfloored tents had no stoves. Cold water baths were all that existed for most men, and many of those were entirely open.

The Kelly Field Orchestra

In 1917, San Antonio was still a small town, filled with ever present reminders of its recent frontier past. Prospective pilot S. E. Elliott recalled it as a "roaring, wild west town" filled with soldiers with money to spend and plenty of local citizens willing to help them spend it. "San Antonio," he wrote, "seemed to abound in saloons that were decorated with extremely long cow horns on the walls, and with glass enclosed, realistically preserved habitants of the state, including coiled rattlesnakes and hairy tarantulas, to greet the visitor's startled eye from many nooks and corners." Encouraged by local patrons, the youthful soldiers discovered that after more than a few toasts to the heroes of Texas, to "the beautiful women of Texas and, in consideration of us foreigners, one to President Wilson, even the faces of the tarantulas seemed a bit genial." Lieutenant John Loeblein, who served as a maintenance officer at Kelly, remembered the excitement of the weekly dances held at the Officers' Club on Kelly Number 2. "Many of the squadrons on the field had their own orchestras," he recalled. "And, believe me, they were good." The officers' dance was always on Friday night, allowing the enlisted men to hold their dance on Saturday evening. Only one squadron at a time could hold a dance, and that squadron provided the musicians. "It was also understood," said Loeblein, "that officers would not hang around at the enlisted men's dances and vice versa." The dances were the supreme social event of the week, and dozens of local girls attended, each accompanied by chaperones. While soldiers going into town could experience a rowdier time, social activities on the field were tightly monitored. Still, Loeblein remembered that the "moonlight dances were just out of this world."

Aside from visiting the saloons of San Antonio or participating in a weekly dance, soldiers at Kelly could, time permitting, make use of other recreational facilities. The Young Men's Christian Association ran a reading room, for example, and sponsored a number of theatrical productions. Out of this effort emerged a traveling troupe called the Kelly Field Players, which toured northern Texas and southern

Oklahoma for several weeks with a musical show entitled "The Follies Militaire." The troupe included singers, acrobats, comics, mimics, musicians, and actors. Female parts were played by young ladies from Mrs. Matlack's Finishing School (chaperoned by Mrs. Matlack, of course). Kelly also had a glee club, hobby clubs, and numerous athletic teams.

The Trade Test Board

For all the importance attached to providing social outlets for the men, Kelly's main task was to develop skilled aviation personnel. The hectic pace of the early months resulted in constant changes in the organization of the training brigade. By January 1918, however, the system for receiving, classifying, and organizing aviation recruits was operating more smoothly. The tents of the 1st Training Brigade filled most of the area from Kelly Number 1's hangar line along the railroad tracks to the east. The 2nd Training Brigade, created in December 1917 under Colonel E. F. Goodrich, occupied much of the northern portion of Kelly Number 1 along the Frio City Road. As new recruits arrived, they joined the 1st Training Brigade. Temporarily assigned to a tent, issued uniforms and equipment, and initiated into the Army's record keeping system, the new recruits were tested as quickly as possible by the Trade Test Board, created in the fall of 1917, classified according to skills and trades and reassigned to a specific tent line housing other men with the same trades classification. All "mechanics" or "welders," for example, lived in the same area.

The Air Service filled various squadrons by taking men from the appropriate "trades area" in whatever numbers needed. Once a squadron had its proper number of men, it moved as a unit to a barracks, if lucky, or a tent row in the 2nd Training Brigade area. There its men received intensive training as the squadron prepared for deployment overseas or to another field in the United States. Eventually, the 1st

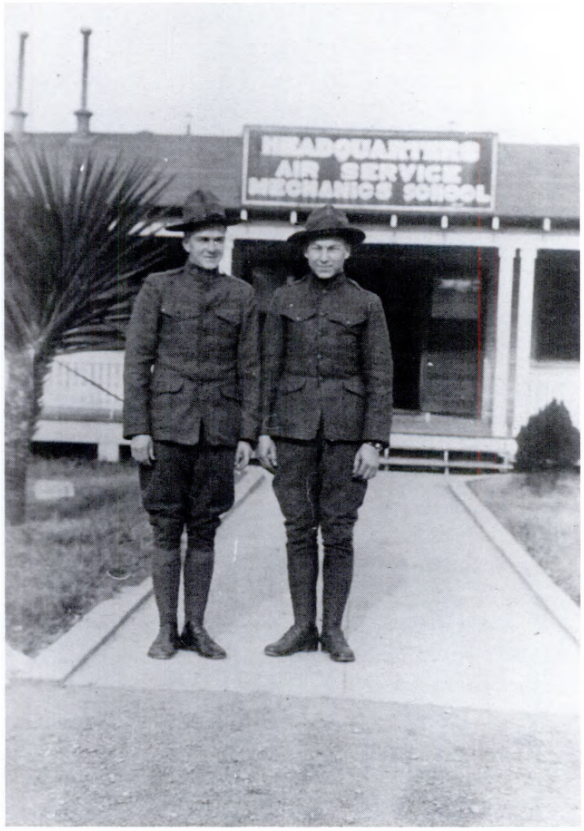

Training of aviation cadets was underway by the fall of 1917.

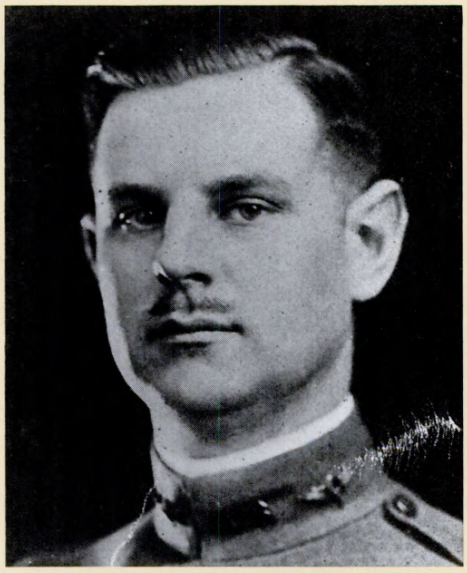

Training Brigade would be known as the Concentration Brigade, since in it were concentrated all the new recruits as well as the specialized squadrons which handled the testing and classification processes. By January 1919, the Trade Test Board had tested and classified by trade over 90,000 men.

The Air Service Mechanics School

The 2nd Training Brigade also operated a number of specialized schools to train both officers and men in particular specialties. The best known of these was the Air Service Mechanics School, which at its peak turned out almost 2,000 aircraft mechanics a month. The first effort to train aircraft mechanics got underway in October 1917, when a handful of prospective mechanics began classes in twelve tent hangars. On the evening of the first day of classes, though, a wind storm blew the hangars down, temporarily closing the school until more permanent facilities were available. A week later, instruction got underway once again, but this time a problem existed with the irregular attendance of many student-mechanics. Largely due to other assigned duties, including guard duty, fatigue details, and kitchen police duty, some students managed to attend only once a week. In addition, the classroom hangars were unheated, and an

Trainees in front of the headquarters of the Air Service Mechanics School.

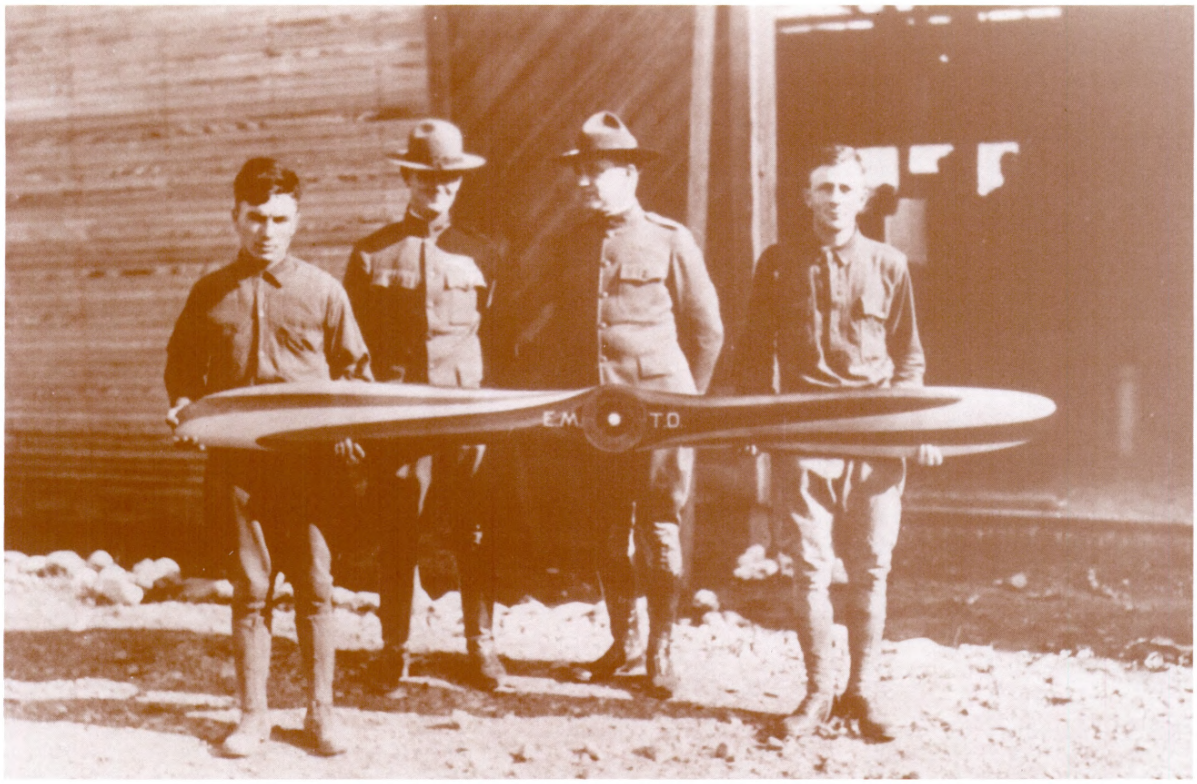

George Edward Stratemeyer

A 1915 graduate of the United States Military Academy at West Point, Stratemeyer served in the infantry until 1916 when he was detailed to the Aviation Section for flying training. After winning his wings, he served with the 1st Aero Squadron at Columbus, New Mexico. In May 1917, Stratemeyer organized and commanded the School of Military Aeronautics at Ohio State University. He came to Kelly Field in January 1918 as Chief Test Pilot and Commander of the Enlisted Mechanics Training School. He was still the commander when the school moved to Chanute Field, Illinois, in 1920.

After serving in a variety of positions during the interwar period, Stratemeyer became General Henry "Hap" Arnold's aide in 1941, and was promoted to brigadier general. In 1943, he went to the China-Burma-India Theater as a major general. While there he was promoted to lieutenant general and became Commanding General of the Army Air Forces in China

In April 1949, Stratemeyer became Commander of Far East Asia Air Forces, which he led through the first year of the Korean War. On May 20, 1951, he suffered a serious heart attack. He retired from active duty on January 31, 1952.

Propeller manufacturing was only one specialty taught to prospective mechanics.

unusually cold fall forced the instructors to take numerous breaks for physical exercise in an effort to warm the shivering students. At one point, the instructors improvised stoves by using blowtorches aimed down into boxes of sand so the students could warm their hands. Despite these handicaps, by early December, the school managed to produce over 1,000 mechanics in a series of month-long sessions.

However, in mid-December, twenty-two of the twenty-eight squadrons supplying students at the school left Kelly Field, effectively closing the school down. In response to increased demand for mechanics, the commander of the school, Captain D. J. Neumuller, had already cut the course from a month to two weeks. He now urged Air Service headquarters to assign students to the course, relieving them of the other duties that interfered with instruction, and also argued that competent mechanics could not be trained in less than a full month.

In response to Neumuller's complaints, Air Service authorities ordered a complete reorganization and ordered Major George E. Stratemeyer to take command of the program. Stratemeyer arrived from Columbus, Ohio, in January 1918. He obtained seven of Koerner's steel-and-concrete hangars for classrooms, added more officers to the staff of instructors, and insisted upon screening all prospective students prior to including them in the course of instruction. He also subdivided the course to achieve greater specialization and altered the balance of theoretical instruction and field practice from about fifty percent of each to a ratio of twenty percent classroom theory and eighty percent hands-on training. To head the Airplane Department, Stratemeyer yanked a young trainee named Edward C. J. McShane out of the Ground Officers' Training School and had him directly commissioned as a first lieutenant. Other cadets were brought in as subordinates to head other divisions. Leo G. Shippy became head of the trades division and Ernest Richardson took charge of engines. Like McShane, both of these men were given direct commissions.

Initially, courses in the reorganized school ran for two-week periods, and were extended to three weeks in February. In March, the curriculum was again revised. To provide a means of actually assigning students to the school, the Air Service authorized the formation of a Provisional Training Battalion, with

the instructors assigned to the 325th and 326th Aero Squadrons, later shifted into the 860th and 870th Aero Squadrons. Stratemeyer was also able to persuade his superiors to extend the course so that by the summer of 1918 the course was three months long. By this time the school could handle some 2,200 students in an increasing number of specialties. In September, Stratemeyer introduced the idea of taking the student-mechanics up on orientation flights. Although this was done primarily to give them an understanding of what went on in the air, it also served as a subtle reminder of how crucial their work was. As the "Kelly Field Eagle," the field newspaper, reported: "There's nothing like a 2,000 foot ride for turning a lax student into the most careful of workers." By the Armistice almost 3,200 men had completed the revised course, and the school was widely hailed as one of the premier mechanics training programs in the world. Almost completely closed down in the general demobilization that followed, the school continued to produce a handful of mechanics for the next two years. In 1920, the Air Service moved it from Kelly Number 1 to Chanute Field, Illinois.

Other Specialized Schools

Another school, operated by the 2nd Training Brigade, was the School for Bakers and Cooks. In the fall of 1917, two officers, one captain and one first lieutenant, and twelve sergeants arrived from Fort Sam Houston and Camp Travis to begin a course in mess management for seventeen junior officers. Within a few weeks all mess sergeants and cooks at the field also had to take the course, taught in tents and mess facilities throughout Kelly. By the end of World War I over 100 mess officers, 165 mess sergeants, and 2,200 cooks graduated from the course, most of whom served as mess supervisors and cooks at Kelly.

Another of the specialized schools operated at Kelly was the Ground Officers' Training School. Organized in September 1917, this school was intended to produce supply and engineering officers and adjutants. In many ways, this school was the forerunner of the Air Force Officers' Training School. Students in the school were, like their counterparts in the flying department, termed cadets and received commissions upon graduation.

The Kelly Field Ground Officers' Training School began operations on Kelly Number 2, but moved to Kelly Number 1 in December 1917. The initial curriculum included some 272 hours of instruction over eight weeks, including sixty hours of infantry drill; but the desperate need for officers forced officials to shorten the course to seven, then six, weeks by the end of the year.

Then, in January 1918, the Air Service decided that the specialized training of ground officers could be better handled by a series of different schools around the country. Accordingly, ground schools appeared at the Massachusetts Institute of Technology (engineering officers), Ohio State University (adjutants), and the Georgia Institute of Technology (supply officers). The last class to enter the Kelly Field Ground Officers' Training School arrived on January 5, 1918. A week later its members were scattered to the newly created specialty schools, and the Kelly Field school was closed.

The School for Cooks and Bakers produced over 2,000 cooks.

The San Antonio Aviation Supply Depot warehouses in 1920.

The San Antonio Aviation Supply Depot

As Kelly Number 1 became crowded with the tents, barracks, and mess halls associated with the training brigades and their associated schools, flying was increasingly shifted north to the adjoining Kelly Number 2. More and more, Kelly Number 1 was home to support activities, including supply and maintenance. In 1917, the San Antonio Aviation Supply Depot, established at Fort Sam Houston in 1914, was supervised by Lieutenant Julius C. Tips and located in a warehouse on South Flores Street in San Antonio. Its administrative offices were on the second floor of the Tips Hardware store on Commerce Street.

The rapid increase in flying operations during the spring of 1917 forced the depot to expand. In September, Lieutenant Tips secured a warehouse on Kelly Number 1. In January 1918, the small staff of the depot was augmented by the assignment of the 675th Aero Squadron as an aero supply squadron. A few weeks later, the 662nd Aero Supply Squadron also joined the depot, bringing its enlisted strength to some 300 men. In late April, Captain Samuel Anable arrived to supersede Lieutenant Tips, and in August 1918, Captain Anable was superseded by Colonel William F. Pearson, who continued in command of the depot for the remainder of the war.

In an effort to consolidate supply activities at regional centers, Air Service officials decided to form an aviation general supply depot at San Antonio and construction began on a large warehouse at Kelly Number 1 in October 1917. In June 1918, the depot completed its move from downtown San Antonio to the new warehouse.

The depot on Kelly Number 1 was an immense concrete-and-steel structure built by the same Stone and Webster contracting firm responsible for building Kelly Number 2. Almost 900 feet long and 300 feet wide, the depot building was divided by a pair of tracks leading directly from the main rail lines south of the field and was internally subdivided into eleven separate warehouses. Between 200 and 300 railcars arrived with new material and left with issue items each month. Post-war demobilization slowed the

pace of depot operations considerably, of course, but it remained open, partly because so many flying units were concentrated at the field from 1920 to 1921.

In 1921, the Air Service decided to consolidate repair and supply depots for greater economy, and brought the Air Service Aviation Repair Depot from Dallas to join the existing supply depot on Kelly. The resulting organization was known as the San Antonio Air Intermediate Depot, a direct organizational ancestor of today's air logistics center.

Flying Training

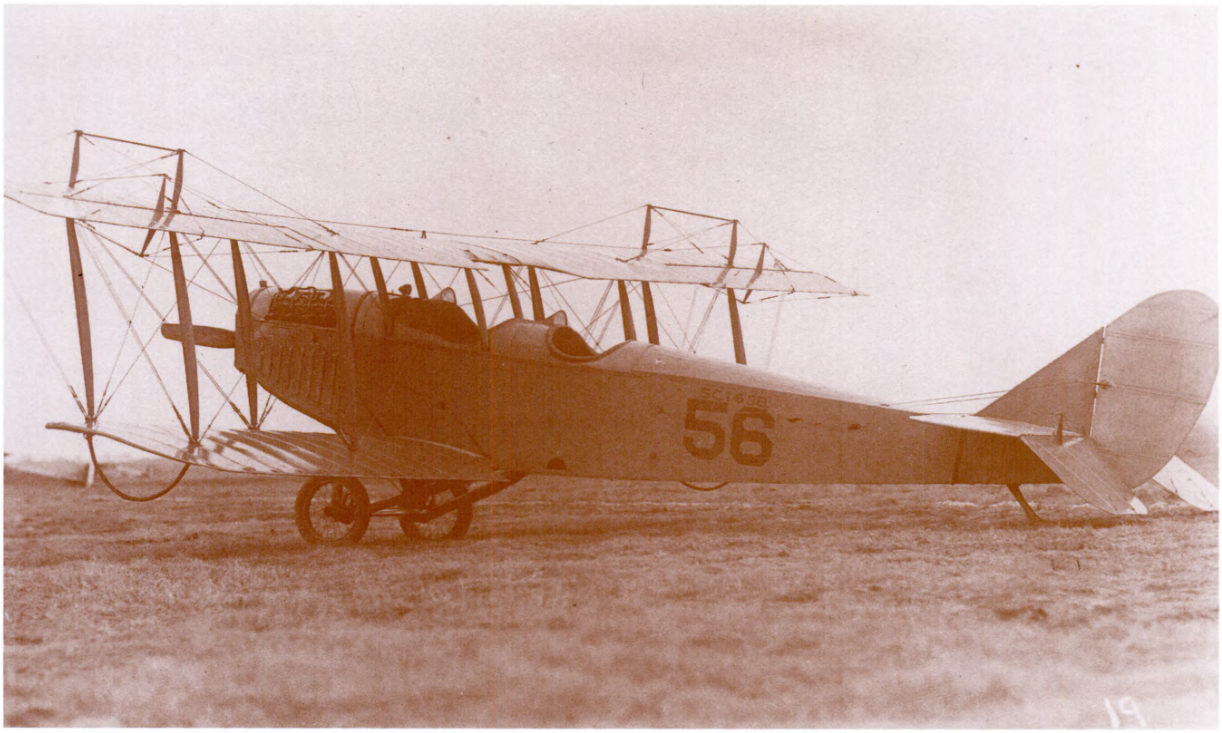

Kelly Field was more than just a reception center for recruits and a supply center; from the beginning it was also one of the most important basic flying schools in the United States. Although instructors began teaching the rudiments of flying to prospective pilots as early as August 1917, the Flying Department was not officially organized until mid-September. Located on Kelly Number 2, the Flying Department assumed responsibility for all aspects of flying training.

The Course of Instruction

Pilot instruction was a rudimentary science in 1917, especially in the United States. Immediately following American entry into the war, a board of officers hurriedly traveled north to investigate Canadian training methods and facilities. Although Allied aviators were on their way to the United States

Future pilots get their first close look at a "Jenny."

The JN-4 "Jenny" was the most widely used trainer during World War I. It would serve until the mid-1920s.

Arrival of the First Cadets

On August 1, 1917, a group of eleven young men assembled at Kelly Field prior to attending the School of Military Aeronautics at the University of Texas, Austin. These young men were all prospective flying cadets, and would become the fourth of eighty-one classes to attend the Austin ground school before returning to Kelly to earn their wings. The first three classes bypassed Kelly, going overseas for their flight training.

As the group stood at the edge of the field, Major Seth Cook approached, offering to take them up one at a time for familiarization flights in his JN-4 "Jenny." All of them eagerly accepted, and the first chosen to fly with Major Cook that day (thus becoming the first cadet to go aloft from Kelly Field) was John Ireland.

Flying was risky in the early days. Four of Ireland's classmates were killed in training. The first was Cadet Sidney J. Brooks, a San Antonio native who became Kelly Field's first training fatality. Only one of the eleven made it overseas: Hugh Brewster shot down two German planes while flying a SPAD VIII with the 49th Pursuit Squadron in September 1918.

Thirty-five years after John Ireland took that first exhilarating ride with Seth Cook, he was an engineering aide with Kelly's Aircraft Repair Division. From his office window he could see the spot he first flew, less than a hundred yards away in front of building 324.

to offer advice on how to structure a pilot training program, the Army decided not to wait for their arrival and simply adopted the Canadian system. (Among other things, the board also recommended adoption of the hangar design used at Camp Borden, Ontario, as the "standard" design for American hangars. This design featured laminated wood beams held together with bolts, wooden siding, and large sliding doors. The hangars on Kelly Number 2, as well as hangars all across the country, were built this way, making Koerner's steel-and-concrete hangars on Kelly Number 1 unique.)

The Canadian system began by putting all prospective pilots, deliberately called aviation cadets, into the classroom for eight weeks of theoretical study. With the help of Yale University Professor Hiram Bingham, the Army promptly created six ground schools in May 1917 at Cornell University in New York, the University of Illinois, the University of California, Ohio State University, the Massachusetts Institute of Technology, and the University of Texas in Austin. Two additional schools appeared later at Princeton University in New Jersey and the Georgia School of Technology (Georgia Tech). Instruction at these schools during the first few months was erratic, with many instructors only partially prepared. Few had any background with aviation. But, the Army soon standardized the curriculum, with courses in engines (thirty-five hours of

Cadet Sidney J. Brooks

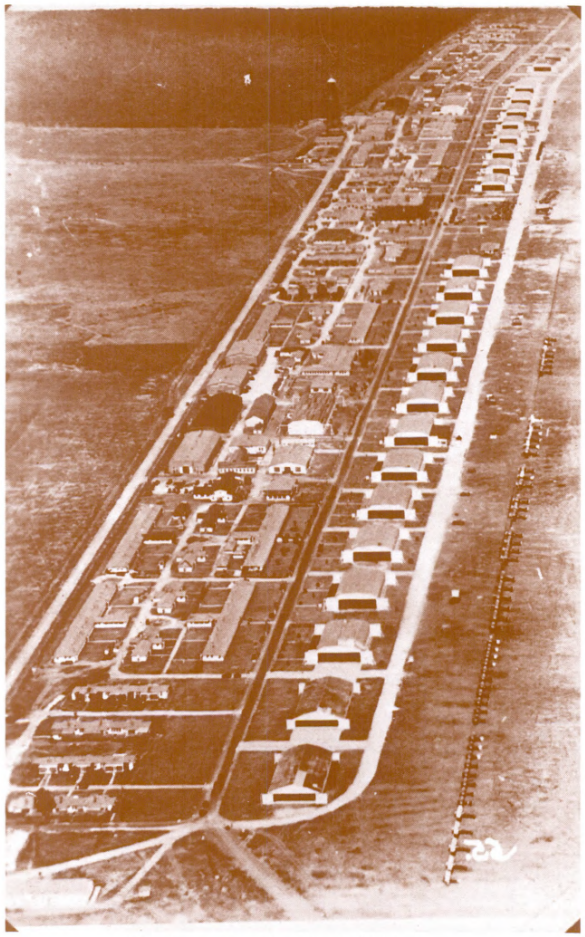

Student flyers were identified by white bands on their caps.

instruction), observation (thirty-one hours), meteorology (two hours), signaling (twenty hours), gunnery and bombing (twenty-four hours), and airplane construction and theories of flight (twenty-one hours). Naturally, they also had regular drill instruction.

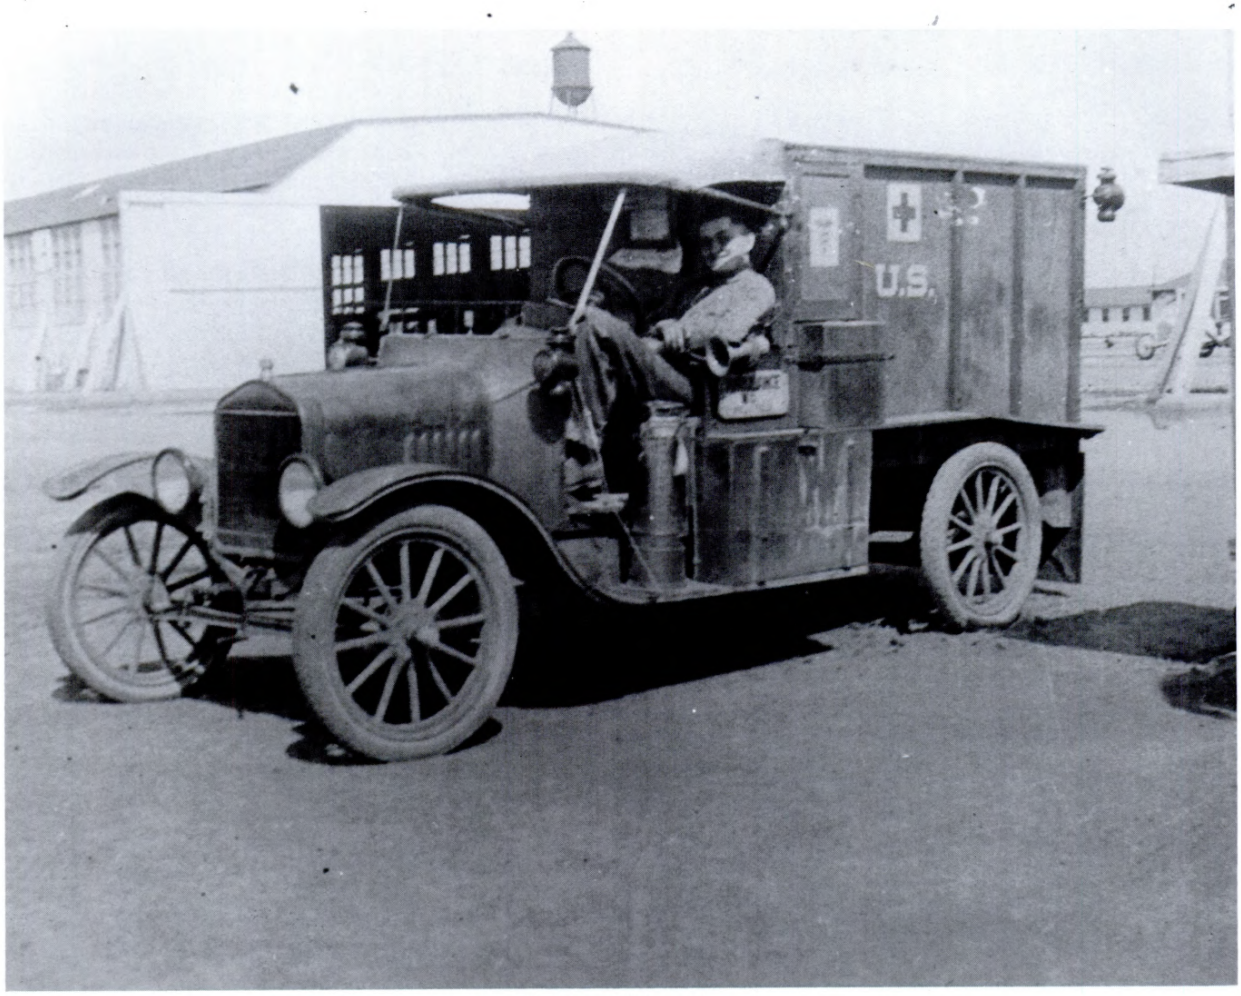

By regulation all the young men accepted for aviation training had to be under twenty-five, have two or three years of college or technical training, and be athletic, honest, and reliable. Many were naturally impatient with the ground school portion of their training, and were eager to get into airplanes as quickly as they could. Future General Howard Craig (who retired as Commandant of the National War College in 1955) enlisted in the Air Service in 1917 and attended ground school at Princeton. He remembered struggling with the classwork. Eventually, Craig had to plead his case before an Academic Board, which permitted him to continue.

Following ground school, cadets went to flight school for a further six to eight weeks of instruction. Commissioned after successfully completing this portion of the training program, they then went on to an advanced school for a brief one-month course in a particular specialty--pursuit, bombardment, or observation. New pilots accumulated only about ninety flying hours before being considered ready for the front, and many had less. The first cadets arriving at Kelly Field from the ground school at the University of Texas reached the field on August 6, 1917. (One of the cadets in this first group was San Antonio native Edgar Tobin, who would go on to become an ace during the war and return to Kelly as an instructor in 1919.) Four JN-4 "Jennies" and twelve Curtiss Model R-4 trainers were available, but there was little time for instruction (and a shortage of instructors). Some flying instruction may have taken place, but it was minimal, even by the standards of 1917. These first cadets, along with the next three classes to arrive, were simply shipped on to get their flying training overseas.

Flight training proceeded by a series of steps known as stages, and began with the dual instruction stage. With the instructor initially handling take-offs and landings, the student was coached through increasingly difficult maneuvers. After some four to

The Kelly Number 2 Flight Line

The Kelly Field "Meat Wagon"

nine hours of this, the instructor turned the student loose to solo. This stage might include up to twenty-five further flying hours, with some additional dual instruction thrown in. The solo stage was followed by cross-country and formation flying and acrobatic instruction for another twenty-five or so hours. During each stage, the cadet also continued to attend ground classes on various subjects such as navigation and the proper conduct of officers.

In 1918, the Air Service replaced this stage system with the British-developed Gosport system, sometimes referred to as the "all thru" system in American manuals. In the Gosport system a single instructor stayed with the same group of students throughout their primary flight training, and the various stages overlapped. A key feature of this system was the use of a speaking tube by the instructor, who now sat in the rear seat of the aircraft and could correct errors verbally. In the stage system, the instructor usually sat in the front cockpit, and tried to direct the student by hand signals. It was difficult, if not impossible, for an instructor to convey much in the way of complicated instructions using this technique, at least while in the air.

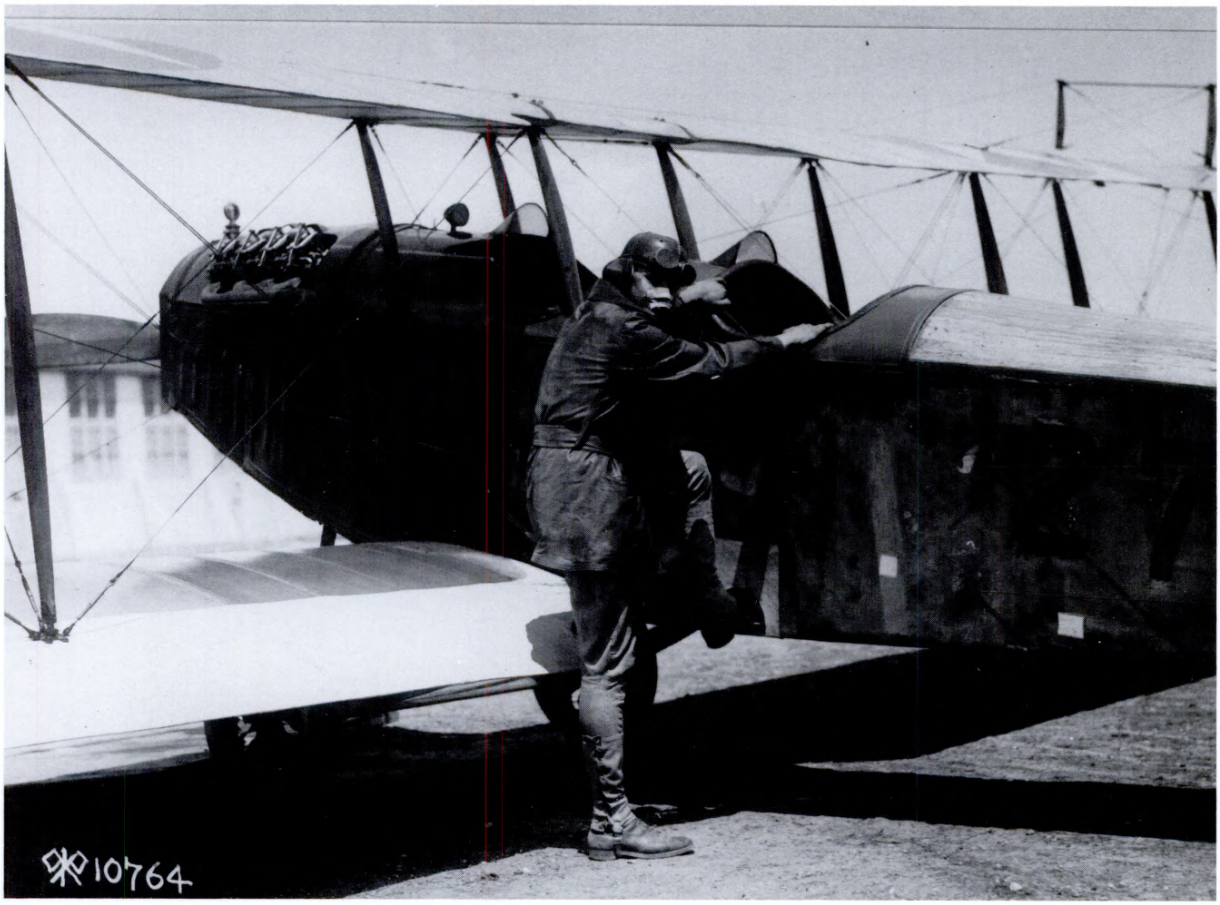

While it was a distinct improvement over existing training methods, the Gosport system was not fully adopted until late in 1918, meaning that the vast majority of Kelly's aviation cadets learned their skills in the older "stage system." Whichever system was followed, flying was still a rough-and-ready business. One manual urged pilots to "look over the machine in a general way" before they climbed into the aircraft and added the admonishment to "be sure the controls are working properly."

Fatal crashes were, fortunately, fairly rare. But non-fatal accidents were frequent. Cadet Carl Foster remembered one such incident:

> After some tight eights over the cemetery and a tower for the other point on a Saturday afternoon, I came in for a landing over Hangar 1 directly into the sun in full view of the men lined up across the field for retreat. Before I could land, Lieutenant Heartfield came plunging into me from my right side and we crashed. I recall my nose was terribly itchy and as I crawled out of what was left of my plane, Ray Coward came out in a motorcycle and said, 'Get in,' to which I recall telling him I would walk in, and proceeded to fall flat on my face.

Foster did not remember anything else until awakening in the infirmary with the doctor sewing up his nose. The driver of the field ambulance, known locally as the "Meat Wagon," later told him that on the way to the hospital he'd stopped at a drug store for refreshments. Coming out, the driver said he found Foster and Lieutenant Heartfield engaged in a fistfight over which would have the first drink. Cleared by a court of inquiry, Foster was soon back in the air.

His case was not atypical. Another student pilot remembered losing control of his Jenny and crashing from about seventy-five feet. "To be sure my folks would recognize me when they shipped me home in a casket," he said, "I covered my face with both hands." Opening his eyes hesitantly, the young pilot found "my feet were still there." Getting out, he reported to the officer in charge and was promptly put into another plane, apparently a technique designed to ensure that pilots would not lose their nerve after a crash. "This time," reported the apparently unshaken flyer, "I kept my nose down and came out O.K."

After minor accidents, student pilots were encouraged to go back up right away.

The Flying Stinsons

Eddie Stinson

Among the first four flyers to land at the newly cleared field in April 1917 was a young San Antonio civilian named Eddie Stinson. His presence with the Army pilots was no accident, despite his non-military status. The Stinsons were already famous for their pioneering efforts in aviation, and Eddie himself was, for all his skill, actually less well-known than his sisters, Katherine and Marjorie.

Katherine was just twenty-one years old when she soloed in July 1912, becoming just the fourth American woman to gain a pilot's certificate from the Federation Aeronautique Internationale (FAI). The following April she and her mother formed the Stinson Aviation Company, and Katherine began touring with her own Wright-B "Flyer." In 1913, the family moved to San Antonio and somehow Katherine got permission to use Foulois' former sheds at Fort Sam Houston to store her plane. She also got permission to use the parade ground as a landing field. A year later, her nineteen year old sister Marjorie became the ninth woman to earn an FAI certificate.

The flying sisters earned money touring and teaching. In May 1915, Katherine also became the first woman to fly the mail in Texas. During this time, their mechanic was their brother, Eddie. Despite his eagerness to fly with them, neither would teach him; perhaps because he had a reputation for drinking. But during 1915, Eddie scraped up enough money to pay for lessons at the Wright School in Dayton, Ohio.

Eddie joined his sisters in San Antonio in the fall, just about the time the 1st Aero Squadron arrived from Fort Sill, Oklahoma. Evicted from Fort Sam Houston, the family leased a 750-acre tract south of the city and built their own field.

With World War I underway, the Stinsons began training Canadian pilots at their field. During 1916, Katherine toured western Canada, Japan and China while her sister handled the instruction. Eddie helped teach acrobatics to the pilots of the 1st Aero Squadron. During this period he allegedly discovered, apparently by accident, the secret of escaping from a spin.

Impressed, Benny Foulois is said to have demanded that Eddie teach the technique to all his pilots. When the field that would become Kelly opened in April, Eddie Stinson was a natural choice to lead the three Army flyers to it.

Diagnosed as tubercular by an Army doctor, Eddie could not get a commission. Near the end of 1917, while serving as a civilian instructor at Kelly, his frustration triggered a monumental bender. Eddie awoke to find himself a private in the Army. Hustled back to Kelly by irate officers, he was soon back at work as an instructor. When Army officials denied his request to go overseas, he disappeared for a week to drink away his disappointment. His instructor's skills were desperately needed, but the Army did not want to have a soldier who was periodically going AWOL (absent without leave) , nor were senior officers happy at having a private instruct officers (especially a private with Eddie's wild reputation). So, he was quietly discharged and hired as a civilian again. For all his bad habits, Eddie was a superlative flyer. His aerial demonstrations left other pilots awed. For the rest of the war he served as a civilian instructor pilot at Kelly.

Katherine Stinson stopped flying in 1918. Exhausted by her touring schedule, she contracted tuberculosis, fighting the disease for six years before recovering. She married in 1928, but did not fly as a pilot again. She died in 1977 at the age of 86. Marjorie flew as a barnstormer until 1928, and quit altogether in 1930. She died in 1975 at the age of 79. Eddie founded the Stinson Aircraft Corporation in Detroit during the 1920s and was a leading figure in the aviation enthusiasm of the 1920s. On January 25,1932 he was fatally injured when he crash-landed on a Chicago golf couse while demonstrating one of his planes to a customer. Stinson Field in San Antonio remains an active municipal airport and a fitting memorial for a remarkable flying family.

Marjorie Stinson with her instructor John Frost

Serving as an instructor under these conditions could be nervewracking. Lieutenant John Loeblein remembered instructors using the cockpit fire extinguisher to knock out panicked students who would not release the controls. In a similar vein, M. Gould Beard recalled struggling with his instructor over the stick while practicing spin recovery. Beard was worried that his instructor, Lieutenant John St. John, thought he'd "frozen" at the controls and would ground him. Apparently, this was not the case. Beard was soon flying again and soloed shortly afterward. But Lieutenant St. John "never went up with me again."

More aircraft arrived in September and October 1917, allowing training to increase as Kelly Number 2 neared completion. Named commander of Kelly Field in October, Colonel William D. Chitty promptly reorganized the Flying Training Department and the Ground Officers' Training Department. Reorganization, though, did not end all problems, one of which was the rapid rotation of officers through Kelly Field. The first commander of the newly reorganized Flying Training Department, for example, was Major W. E. Wilbourn, a former cavalryman who had served with Colonel Chitty in the 12th Cavalry. Wilbourn, however, was succeeded by Major Harvey Burwell, the youngest major in the Army, at the end of November. Major Paul Ferron, a member of the 1st Aero Squadron before the war, succeeded Burwell only two weeks later. Nevertheless, by the end of December, 261 cadets were hard at work, logging 229 hours and thirty-six minutes in the air on December 27 alone. Indeed, by the end of 1917, student pilots at Kelly had accumulated almost 6,000 flying hours.

These totals continued to increase during the first months of 1918. The number of cadets taking instruction more than doubled during January, with almost 600 embryonic flyers competing with aviators in the new instructors course for air time. In February, Kelly's student pilots logged 9,500 hours, and the Flying Department scheduled over 12,000 hours of flying during March. By this time Kelly's pilots were flying more hours than the pilots at all other training fields combined. On March 18, with over a 100 aircraft in use, they logged an incredible total of 1,033 hours and 29 minutes of flight time. The sky over south San Antonio was crowded during daylight hours.

From the peak in early 1918, both the number of cadets in training and the number of flying hours began a steady decline. Instructor training shifted to newly constructed Brooks Field in September 1918, and in August the number of cadets at Kelly Field dropped below 300 for the first time since the preceding December. Still, by the Armistice 1,459 Army pilots had emerged from the Kelly Field training program, with the advanced program generating another 298 instructor pilots. Kelly Field flyers logged 153,876 flight hours during seventeen months of operation. One civilian and twenty-five military pilots died in accidents.

Lieutenants Harold Clark, Frank Bell, W.W. Meyer, H. Spencer, and Sig Landers were instructors at Kelly during the immediate post-war period.

Kelly Field in the Post-War Years

Armistice Day, November 11, 1918, found the field still crowded with recruits and flying cadets. Cadet M. Gould Beard remembered being awakened early on the morning of November 11 by the sounds of celebration coming from San Antonio:

> "There was dead silence for about thirty seconds, and then the whole barracks sat up and started cursing at the floor, damning the Germans for having lain down on the job before they had a chance to get over there and prove their merit as aviators. There was no enthusiasm for the Armistice in those cadet barracks."

Kelly Field's Victory Loan Flight included Majors George Stratemeyer and Edgar Tobin (standing in the center of the second row), along with Captains H.H. Powell and S.E. Mitchell, and Lieutenants D.R. Phillips, E.P. Streeter, F.B. Estell, F.C. Carroll, J.L. Whitney, F.L. Smith, A.M. St. John, P.A. Smith, H.C. Roberts, L.R. Hewitt, G.H. Behler, and C.J. Morris.

Discipline briefly broke down, with cadets simply going to mess when they pleased, "some not bothering to shave." Beard and a few of his fellow cadets went into the city that afternoon. Downtown, they were happily pelted with flour by local citizens and had their faces pasted with shoe polish. After one beer, they fled back to the relative safety of the field. The next morning Beard and nine other cadets received their commissions. Training, however fitfully, got slowly underway once more.

The reaction of Beard and his fellow cadets to news of the Armistice was not typical. The end of the fighting in World War I was greeted in most places with exuberant joy and the immediate demand that the "boys be brought home." In response to this nationwide outcry, and in keeping with traditional American practice, demobilization was incredibly swift. The Army discharged over a million men before the beginning of February 1919 and another 1.7 million men before the end of June. From a total strength of 190,000 officers and men at the time of the Armistice, Air Service strength fell to under 9,600 by June 1920. Of its 1,168 officers, over 1,000 were temporary appointments with uncertain status.

Nevertheless, some recruiting still took place. Many skilled men had left during demobilization, yet their skills were still needed. At one point, the Air Service even agreed to fly prospective recruits from their home to the nearest field. In addition, the Air Service put on air shows and exhibitions--both to celebrate the end of the war and to attract recruits by drumming up enthusiasm for aviation. In early 1919, the Air Service formed a "Victory Loan Flying Circus" of three flights to put on shows all over the country. One of these was formed at Kelly, although it was officially based at Ellington Field outside Houston, under Major George Stratemeyer. The local flight included San Antonio native Edgar Tobin and toured some fourteen states in addition to Texas. On April 12, the team put on a show at Kelly which featured a "German" attack on a "French" village, complete with simulated artillery barrage and aerial bombing. "German" troops then entered the village, looting and abusing the citizens before "American" planes appeared to drive off the enemy. As the planes drove the "German" aircraft away, American soldiers advanced to recapture the village. It was, promised the ad, "a wonderful show" and was fairly typical of the exhibitions put on all over the country by the "Victory Loan" flights during a month-long national tour in April.

Flying Unit Consolidation at Kelly

Demobilization meant the elimination of most wartime flying squadrons. The 27th, 94th, 95th, and 147th Pursuit Squadrons of the 1st Pursuit Group, the 11th, 20th, 96th, and 166th Bombardment Squadrons of the 1st Day Bombardment Group; several observation squadrons; and a handful of balloon companies were all that remained active. In mid-1919,

Pigeons at Kelly Field?

Yes, Sir!

During the early days of World War I, a primary means of frontline communications was not by radio, or the familiar dot-dash (Morse) code system, but by messenger pigeon. As one of the premier flying centers in the United States, naturally Kelly Field had its own pigeon department. Its mission in 1917-1918 involved breeding, raising, and training these pigeons for future use in combat. And, with both sides shooting at anything that flew, messenger duty often proved hazardous for these "flyers."

In most cases, the civilian trainers were professional pigeon handlers. They trained the birds in three phases. The first familiarized the pigeons with their "cote" or home. During the second phase, trainers released the birds in an area closest to the cote. This area was slowly expanded as the bird learned to find its way home. Finally, the trainers took the birds several miles away and released them. Each bird was rated on the basis of distance traveled and time required to make the journey. It was a form of graduation exercise, and as a reward these "flyers" got what many of their human counterparts desired--frontline service in France.

the pursuit squadrons, the bombardment squadrons, and four observation squadrons (8th, 12th, 90th, and 104th) became a wing of three groups at Kelly Field. The 1st Pursuit Group retained its name, as did the 1st Bombardment Group. The observation squadrons were combined into the 1st Surveillance Group. Aside from a few other observation squadrons, most stationed at Fort Sill, these were the only active flying units in the Air Service. Collectively, they became the 1st Wing. In 1921, the 1st Surveillance Group became the 3rd Attack Group.

Border Patrol

Even while the United States fought in Europe during World War I, fighting continued to occur along the border with Mexico. Bandits often raided American ranches for supplies, cattle, and horses, and American cavalry units pursued them into Mexico. In one such clash, over 800 American troopers fought over 600 Mexicans near Nogales, Arizona, in August 1918.

In June 1919, a large force under a still-active Pancho Villa, moved toward Juarez, which was garrisoned by Mexican government troops. In response, Major General DeRosey Cabell, Southern Department Commander, brought in aircraft from both Kelly and Ellington Fields to form a border patrol. When Villa attacked Juarez in mid-June, stray fire hit several American soldiers and civilians on U.S. soil, killing one soldier and one civilian and wounding two soldiers and four civilians. American troops promptly crossed into Mexico to disperse Villa's force. American aircraft, under the command of Major Edgar Tobin, began arriving at Fort Bliss the morning of June 15 and began regular patrols on June 19.

The Army planned to station at least nine squadrons along the border. Two of these, the 9th and 91st Observation Squadrons, were based at Rockwell Field, California (the former North Island Field), while three observation squadrons and the four bombardment squadrons from Kelly Field would operate from small fields along the border from Brownsville to the Arizona border. The aircraft of the 1st Pursuit Group were also soon available, meaning that almost the entire 1st Wing, under Colonel Henry C. Clagett, was committed to the border patrol by the summer of 1919.

The 11th Aero Squadron flew as part of the Aerial Border Patrol

However, by the time the aerial patrol was in place, the threat posed by Pancho Villa was largely gone. Beginning in January 1920, Kelly's Surveillance Group, reinforced by a fourth squadron (the 12th) handled the patrolling chores from a series of small fields along the border. The bombardment and pursuit squadrons remained at Kelly.

Although the aerial patrol did sometimes spot potential raiders, most of the time the young flyers simply cruised over an empty and forbidding landscape. Sometimes pilots got lost and strayed over Mexico. Most of these incidents, despite Mexican protests, were accidental. But occasionally things got rather exciting. In August 1920, for example, Lieutenants Harold G. Peterson (pilot) and Paul H. Davis (observer-gunner) were forced down by engine trouble after mistakenly following the Conchos River into Mexico. Bandits captured them as they tried to hike back to the border, and their captor demanded a $15,000 ransom. Captain Leonard Matlack, a cavalryman stationed at Candaleria, Texas, offered to carry the ransom across. In exchange for half the money, Matlack first brought back Lieutenant Peterson. While returning with the rest of the money for Lieutenant Davis, Matlack overheard the bandits plan to kill both of them. At the exchange, Matlack pulled his gun, faced down the bandits, and rode away with both Davis and the remaining cash.

By the fall of 1920, active patrolling had nearly ceased in favor of experiments in air-ground cooperation, radio communication, aerial gunnery, and formation flying. When Kelly's observation group became the 3rd Attack Group in 1921, the 1st Pursuit Group moved to Ellington Field. During the same period, many of the pilots and men of the 1st Bombardment Group left Kelly to participate in Brigadier General Billy Mitchell's bombing tests. The remainder of the bombardment group, by then called the 2nd Bombardment Group, would leave Kelly for Virginia in early 1922.

Post-War Training at Kelly Field

By the end of February 1919, all the Air Service ground schools were closed, as were most primary training fields. Ground school and primary training were concentrated at Carlstrom Field, Florida, and

March Field, California. In July 1919, Congress limited the total of flying cadets on duty to 1,300 at any one time, an authorization briefly raised to 2,500 by the National Defense Act of 1920 before falling to 500 after budget cuts in early 1921. War Department allocations limited the number of cadet slots even more.

Primary and basic training was initially a four-month course (later it became a six-month course) and was followed by more advanced training with an active unit. Observation students went to the Observation School at Fort Sill until 1922, but in the absence of specialized schools for pursuit or bombardment training those skills were taught by the groups at Kelly. When the 3rd Attack Group came into existence in 1921, it began offering advanced training in that specialty as well.

However, the Air Service began reorganizing this training program even as it was established. In 1921, March Field closed. In 1922, so did the primary school at Carlstrom Field. Replacing them as the site for basic and primary training was a new school at Brooks Field.

Then, in July 1922, the Air Service consolidated all advanced training in a new Air Service Advanced Flying School at Kelly Field. These changes not only made San Antonio the flying training center of the Air Service, they once again brought Kelly to the forefront of American military aviation. For the next two decades, young men who wanted to fly for the Army would find themselves at Kelly.

The DH-4 was a familiar sight in the south Texas sky.

CHAPTER TWO

ALMA MATER OF THE AIR CORPS

The Armistice of 1918 ended the immediate need for large numbers of pilots. Some training continued. The need for Air Service pilots did not disappear completely, but the vast majority of training centers were closed, with the pace and intensity of training slowing dramatically. During 1919, the Air Service concentrated both ground school and primary flight training at March Field, California, and Carlstrom Field, Florida. Congress authorized limited enlistment of flying cadets.

If a cadet survived the course at Carlstrom or March Fields, he went on to advanced training. Observation students went to the Observation School at Fort Sill, Oklahoma, but no schools existed for pursuit or bombardment training. Advanced flying students in those specialties received their training with either the 1st Pursuit or 1st Bombardment Groups, both at Kelly Field until 1921. The flying groups provided instructors for both ground classroom and aerial training in tactics, aerial gunnery, and battle maneuvers. At the same time, service with active units gave them experience with supply, engineering, operations, and Army paperwork. Pursuit students progressed from the "Jennies" to DH-4 two-seaters and then to SE-5 fighters leftover from the war. Bombardment students transitioned to DH-4s, too, with a handful moving on to Curtiss and Martin NBS-2 series aircraft when those became available. Creation of the 3rd Attack Group at Kelly Field in 1921 opened up a fourth specialty. Students in it also flew the DH-4, the all-purpose Air Service craft of the early 1920s.

Between mid-1921 and mid-1922, this training program was completely restructured in conjunction with a total reorganization of the Air Service. The primary flying school at March Field closed in 1921, and the school at Carlstrom Field closed in early 1922. Concurrently, the Air Service opened a new primary school (now the only one) at Brooks Field and concentrated all advanced training in a new Air Service Advanced Flying School at Kelly Field which opened on June 28, 1922. For the next two decades, San Antonio would be the Army's flying training center, and every young man who succeeded in becoming an Army aviator would finish his schooling at Kelly Field.

The Advanced Flying School was organized in 1922.

The Air Service Advanced Flying School

Primary training at Brooks Field began with the traditional classroom instruction before progressing to flying training in the still-present JN series two-seaters. The flying cadet who survived this six-month long course became a Junior Airplane Pilot and then moved a few miles west to Kelly for another six-months (initially eight months) of specialized training before he could win his commission and wings.

The Advanced Flying School was run by the 10th School Group, made up of the 39th (Observation), 40th (Attack), 41st (Observation), 42nd (Bombardment), and 43rd (Pursuit) School Squadrons; the 13th Air Park; the 22nd Photo Section; and the 10th Group Detachment (headquarters). Although the 10th School Group certainly coordinated its training activities with those of the primary school at Brooks, no higher headquarters existed to supervise all training until 1926.

From 1922 to 1927, training at the Advanced Flying School, located on Kelly Number 2, followed a course of instruction known as the "A" plan. Under this plan, survivors of the primary course at Brooks Field completed about seventy-five hours of instruction. At Kelly the advanced flying cadet received transition training to the DH-4. Once he'd soloed, the cadet flew on his own except for occasional check flights, for approximately twelve weeks, following a basic program similar to the "stage system" used during World War I. James Burwell, who passed through the Advanced Flying School in 1927, recalled a decade later:

> When he graduated, a student had a total of approximately 200 hours' flying time, but knew nothing of instrument flying, radio beam work, or many of the other phases taught today. Even so, he was regarded as being one of the best trained pilots in the world, and it was not unusual, near graduation time, to see representatives of commercial lines on the field offering students who were about to graduate contracts calling for three to four times the rate of pay they were to receive in the Army.

The training was, indeed, both thorough and rigorous. Rarely, though, was there a shortage of applicants. And, with the number of available cadet slots limited by budget constraints to less than 200 during many years, the Air Service could take the "cream of the crop." For example, of 1,288 young men who sought to become pilots in 1925, only 362 passed the cadet examination, and the Air Service took only the top 108. Attrition further reduced cadet ranks. Of the 202 cadets entering training at March and Carlstrom in January 1920, sixty-one graduated at the end of six months. Another forty-three were still in training, but ninety-eight were "washed out." Throughout the 1920s, cadets dreaded the deliberations of the so-called "Benzine Board," the group of officers which determined which cadets would remain in training.

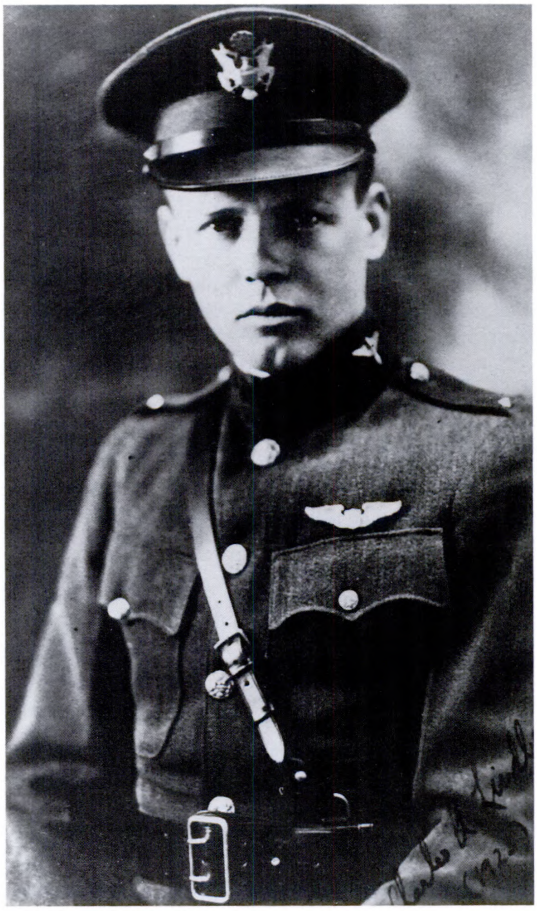

Civilians enlisting as flying cadets had to be unmarried, American citizens, between the ages of twenty and twenty-seven, with a high school education, good character, excellent health, and sound physique. Non-rated Army officers could also apply for flight training, as could Regular Army enlisted men who met the rest of the requirements. Eventually reserve officers, Naval personnel, and officers from several foreign countries would also be accepted. Later, the educational requirement was raised to include two or three years of college, preferably in an engineering field.

"Lucky Lindy" at Kelly

Among the cadets who took advanced flying training at Kelly under the "A" plan was a young Minnesotan named Charles Lindbergh. Having already learned to fly, Lindbergh still found the adjustment

A cadet's first solo was a vital step on the road to a commission and wings.

Charles Lindbergh graduated from the Advanced Flying School in 1925.

to the Air Service difficult. While still in primary school at Brooks Field, he regularly slipped over to nearby Stinson Field to teach a friend to fly an old Jenny they owned jointly. By dint of hard work, Lindbergh was among the thirty-three cadets, from an initial 104, who got to the advanced school in September 1924.

At Kelly, Lindbergh specialized in pursuit. On March 6, 1925, nine days before graduation and commissioning, Lindbergh was part of a nine plane flight practicing gunnery near Galveston. Flight leader Eugene Stevens, who retired from the Air Force as a colonel, recalled: "We were flying S.E.-5 single seaters, when Lindbergh and McAllister accidentally pulled together while zooming upward toward Lieutenant Maughan's D.H.-4." Lindbergh reported that he felt only a "slight jolt followed by a crash." The formation immediately broke up as "pieces of wood from spars, ribs or struts floated away from the crash in what appeared to be slow motion."

Incredibly enough, both Lindbergh and Lieutenant McAllister were unhurt, and both jumped safely moments later. Lindbergh lost the ripcord to his parachute, which got him a good deal of teasing from his fellow cadets, but was otherwise unscathed.

Relieved at the sight of the two chutes, the other members of the flight promptly made a series of diving passes at the wrecked and burning planes, then straggled back to Kelly. The haphazard arrangement upon their return was a sign to the officers on the ground that something was wrong, but Stevens recalled that "it was quickly explained, and that was the end of a perfect day." New planes were soon available for Lindbergh and McAllister, who became the 12th and 13th members of the "Caterpillar Club"--men who successfully "took to the silk" as a result of trouble in the air. Ironically and fortunately, and an example of the circumstances that contributed to Lindbergh's legend, his class was the first to be issued parachutes.

The Air Corps and the Five Year Plan

In July 1926, President Calvin Coolidge signed the Air Corps Act, an outgrowth of War Department efforts to reorganize and strengthen Army aviation. The act officially changed the name of the Air Service to the Air Corps, created an Assistant Secretary of War for Aviation, ordered the Army General Staff to create an Air Section, and authorized an expansion of the Army's air arm over a five-year period. Most of these changes had been outlined by War Department boards investigating aviation needs--the Lassiter Board of 1923 and the Morrow Board of 1925. The Lassiter Board urged a ten-year program of expansion, but its implementation foundered on the issue of the division of aviation money between the Army and Navy. The proposal of the Morrow Board was for a somewhat less ambitious expansion over a five-year period, and this, over the objections of General Mason Patrick, Chief of the Air Service, became the basis of the Air Corps Act passed by Congress.

Although the primary impetus toward reorganization was a desire to increase the number of tactical squadrons, the Air Corps Act had more immediate impact on the administrative aspects of Army aviation. The new law authorized (but did not fund) an expansion from 919 officers and 8,725 enlisted men to 1,650 officers and 15,000 enlisted men by 1932. To meet its officer goal, the Air Corps required an additional 1,485 commissioned pilots. Given that a large percentage would "wash out," suffer fatal crashes, or simply give up during training, planners estimated that this would necessitate bringing in some 500 flying cadets per year. Brooks Field was too small to handle that many student flyers, so in 1926 the Air Corps reopened the primary flying school at March Field. In addition, the schools at both Brooks Field and Kelly Field were joined under the umbrella of the Air Corps Training Center, headquartered at Duncan Field (Kelly Field Number 1) and commanded by Brigadier General Frank Lahm.

A few months later, General James Fechet, Assistant Chief of the Air Corps, suggested that the new training organization should also include the school at March Field and outlined a restructuring of the course schedule so that primary and basic flight training would take place at either Brooks or March Fields for eight months, followed by four months of advanced training at Kelly. Approval of Fechet's proposal meant an end to the "A" Plan training system and ultimately contributed to the construction of Randolph Field as a primary training site.

By The Numbers

At a time when the only thing keeping a pilots' body from almost certain death was constructed of linen-covered spruce, mahogany, or fir, it is easy to see the importance of establishing practices and procedures to ensure the proper handling of aircraft. The following operational checklist is comprised of actual regulations set forth by the United States Air Service in 1920.

1. **Don't take the machine into the air unless you are satisfied it will fly.**
2. **Never leave the ground with the motor leaking.**
3. **Don't turn sharply when taxiing. Instead of turning short, have someone lift the tail around.**
4. **Never get out of the machine with the motor running until the pilot relieving you can reach the engine controls.**
5. **Pilots should carry hankies in a handy position to wipe off goggles.**
6. **Riding on steps, wings, or tail of a machine is prohibited.**
7. **In case the engine fails on takeoff, land straight ahead regardless of obstacles.**
8. **No machine must taxi faster than a man can walk.**
9. **Do not trust altitude instruments.**
10. **If you see another machine near you, get out of the way.**
11. **If an emergency occurs while flying, land as soon as you can.**
12. **Pilots will not wear spurs while flying.**

Only minor changes altered the Kelly Field flight line between 1917 and 1940.

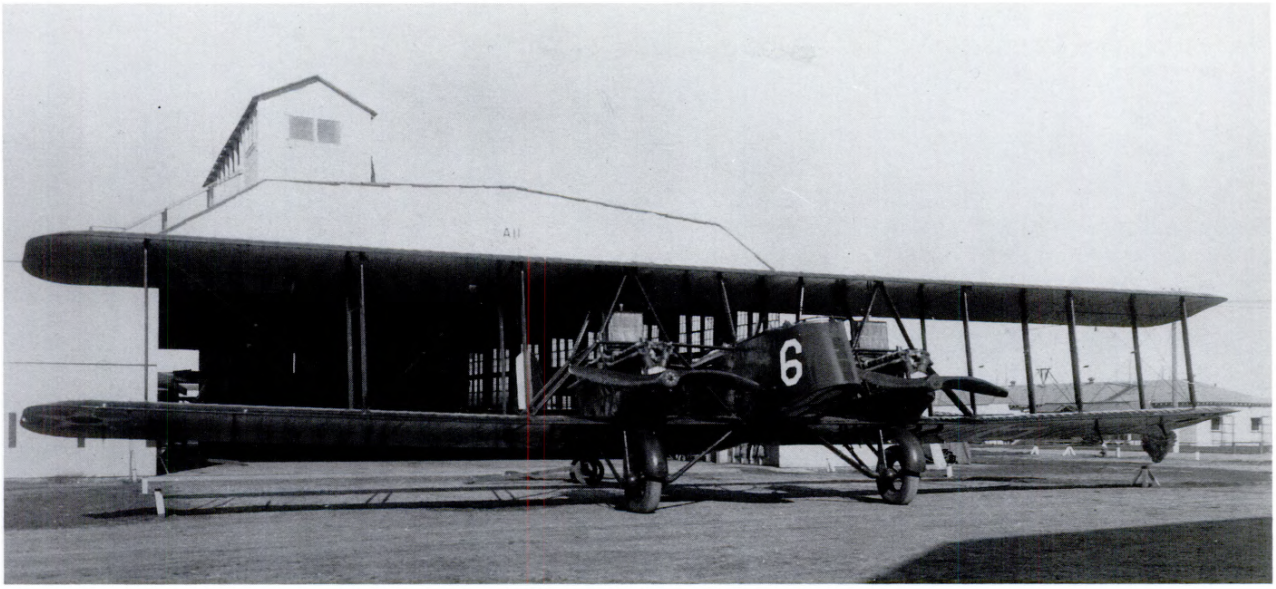

B" Plan Training at the Advanced Flying School

The first class under the new "B" training plan entered primary training in November 1927. Eight months of their year-long journey to wings and commission would be at either Brooks or March Field (both replaced by Randolph Field when it opened in 1930). Shortening the course at what was now the Air Corps Advanced Flying School at Kelly Field simply eliminated the weeks spent on transition from primary to basic training. Although General Fechet's plan was to train all cadets at the Advanced Flying School as observer pilots and observers before they went on to specialized training in pursuit, bombardment, or attack, the now-traditional four specialties remained.

By 1927, the venerable "Jenny" was gone from the primary flying fields, replaced by the Consolidated PT-1, a two-seat biplane powered by a 180 horsepower Wright E engine. The main basic training aircraft until 1930 remained the DH-4, modernized into the DH-4M by using the wings, tail, and engine of the DH-4 on a fuselage of welded steel tubing. Only after reaching Kelly were flying cadets introduced to actual combat aircraft. In the late 1920s these included Boeing PW-9 and Curtiss P-1 pursuits, Keystone LB-5 and Martin NBS-1 twin-engine biplane bombers, Curtiss A-3 attack aircraft, and Douglas O-2 observation aircraft. Flying training was concentrated in the morning hours, with afternoons devoted to classroom instruction on signals, ordnance, and the proper writing of combat orders.

Cadets at Kelly

Cadets arriving at Kelly after surviving the months of primary and basic training immediately noticed differences. For one thing, the facilities, built hurriedly during World War I, were not nearly as nice as those at Randolph. Future General Curtis LeMay came to Kelly in 1929 and found the discipline relaxed in comparison to his experience at March Field. In contrast, Cadet Fred Freyer's class entered shortly after Colonel Henry B. Clagett took charge of the Advanced Flying School in 1932 and found that discipline was even stricter than they'd experienced in the last weeks at Randolph. Clagett, whose nickname was "Sue," was widely known in the Air Corps as a martinet, and he promptly instituted a regular series of formations and limited weekend leave to Sunday. A few weeks later, Clagett relaxed his grip somewhat, giving the cadets Wednesday afternoons and evenings off.

The Curtiss-Martin NBS-1 was the frontline bomber of the 1920s.

Beirne Lay, Jr., a 1933 graduate in the bombardment section who captured his cadet experiences in a 1937 book "I Wanted Wings" and later co-authored the World War II classic "Twelve O'Clock High," noted that the biggest difference between Randolph and Kelly was that, "Hitherto, we had been taught to fly, nothing else. Now, the underlying fact was emerging into our foreground that we had learned to fly an airplane for one reason only, to use it as a weapon." The Advanced Flying School was, he wrote, "school in earnest for military fliers."

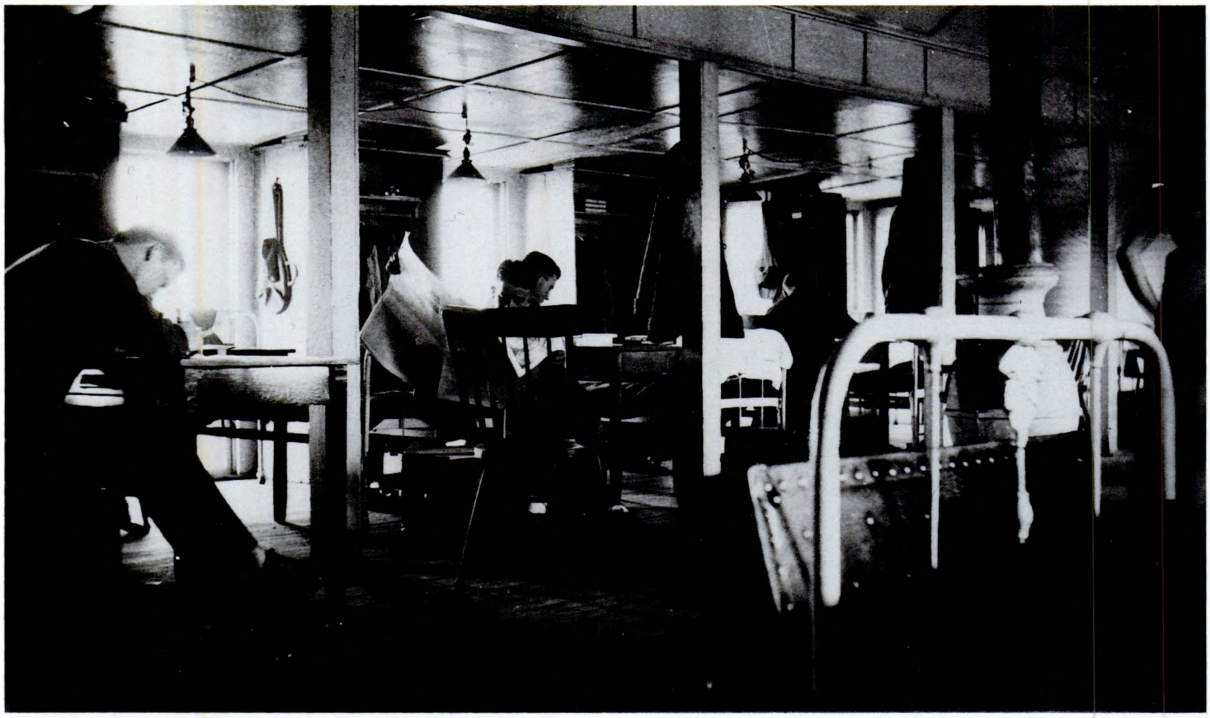

The schedule of activities varied somewhat over the years, but typically, cadets rose at 6 AM, breakfasted at 6:15, and policed their barracks before assembly at 6:50. They were on the flight line by 7:00 and flew until 11:00 on days when the weather was good. To simulate bombing practice, cadets sat at a miniature bomb range constructed on the floor of a hangar. Electric lights flashed to show approximately where a bomb would have landed.

Lunch was at 11:40, and the afternoon was taken up with ground school classes from noon to 3:30. Athletics filled the late afternoon, with supper around 5:30. On many evenings, cadets returned to the flight line at 6:00 PM for up to two hours of night flying.

Passing through the Advanced Flying School a year before Lay, Fred Freyer rose earlier, around 5:15 AM, and had an hour of ground school before reaching the flight line about 7:30. Lights out in the barracks was at 9 PM, although the cadets could stay up until 10 o'clock. Since it was impossible to continue studying in the dark, and most cadets were pretty tired anyway, they typically turned in at lights out.

The Ruggles Orientator was used to test cadet's reactions during violent manuevers.

Cadet barracks were of 1917 vintage and rather spartan, even by the standards of the period.

Discipline and Relaxation

Above all else, cadets were stimulated by their love for flying: which helped them overcome the deaths and dismissals of fellow cadets as well as the constant intrusion of military spit-and-polish; something few had any real interest in. Incoming cadets were known as "Dodos" for the first month of training, which Fred Freyer described as "lower than a freshman in military college." Cadets who failed to maintain an immaculate bunk or foot locker, or who offended an "upper class" cadet or instructor, got demerits. Every five demerits resulted in an hour walk around the barracks, and Freyer recorded the lament of every new trainee when he claimed that he was "gigged" even when he was innocent.

During the first thirty days, all new cadets were restricted to the post and had to get permission to leave the barracks. Roused at 4:40 in the morning, the first activity was a mile run--a sequence familiar to anyone who has passed through military training. By the time a cadet progressed to the basic flying course, they got regular leave on weekends, although discipline was still strict. Leave was also granted around the Christmas holidays.

The demerit system used at Brooks and Randolph was also followed at Kelly. In addition to walking "tours" of varying lengths of time, cadets guilty of infractions at the Advanced Flying School were often simply restricted to barracks or ordered to write essays acknowledging the error of their ways. Freyer was accused of not taking off exactly on time for a cross-country flight (although he vehemently protested his innocence) and was forced to write a 1,000 word essay on "Airdrome Discipline."

On the other hand, cadets did not always let restrictions keep them from their social whirl. Two weeks after writing his essay, Freyer found himself restricted for the weekend. He did not, however, "let it keep me from what I wanted to do. Had a date Saturday night and also Sunday." Freyer was hardly unique in sneaking out, and his technique of making up his bunk to simulate a sleeping form was practiced repeatedly by cadets. Cadet William Yancey, a graduate with Class 38-B, recalled a group arguing with the cadet officer-of-the-day in an effort to get themselves "off the 'returned after hours' list." Stretching the rules to the limit, or even beyond, was the way the game was played.

A Kelly Field polo team. Circa 1930.

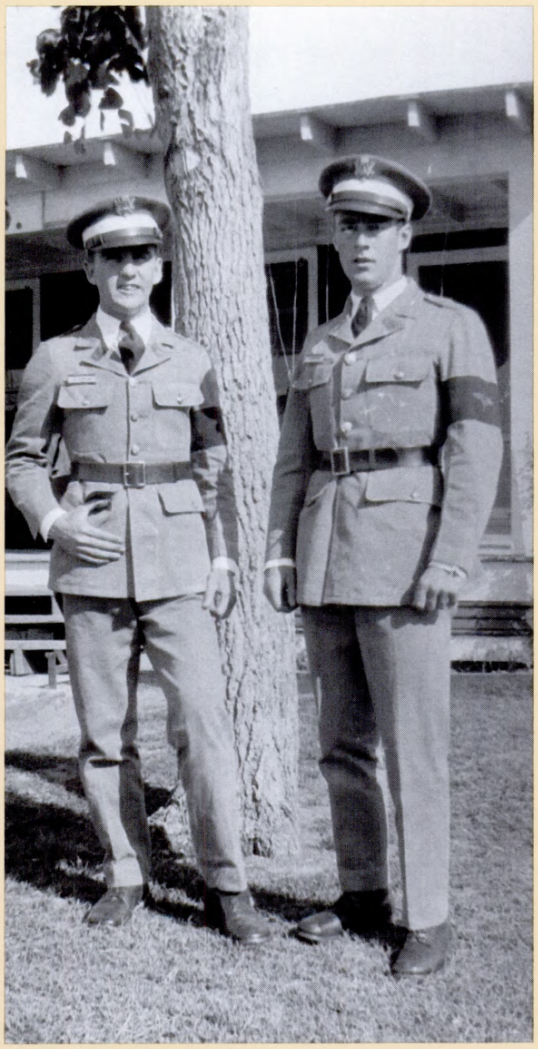

The Sport of Kings and Airmen

During the interwar years, a military officer was expected to carry on many of the traditions of a gentler age, one when officers were indeed gentlemen. Although many of these traditions are still with us, many more have vanished as a result of changes in societal expectations. Among the vanished aspects of being an officer is the emphasis on horsemanship, and its associated fascination with the sport of polo.

Polo was an important sport at nearly every Army post during the 1920s and 1930s, and Kelly Field was no exception. As former commander George Beverley remembered, polo at Kelly began while Major William Garrison commanded the depot on Duncan Field. An avid enthusiast, Garrison persuaded Fort Sam Houston to lend the field thirty-five horses, which were stabled at Duncan Field just north of the Bungalow Colony. The team practiced and played on a large field that then occupied the area across the street from today's Security Police Headquarters, building 105. Prior to the late 1930s, the land between today's Duncan Drive and the Kelly Field flight line was completely empty and made an excellent riding area.

The Kelly polo team actually represented all Air Corps installations in the San Antonio area. Clad in the aviation colors of blue and gold, the team gave a good account of itself in several well-publicized matches, winning the Southwestern Midwinter Tournament in 1929 and 1930 and, at one point, going undefeated for nearly a year. Making this string of successes more remarkable was the relatively poor quality of the team's borrowed horses.

By 1937, the home of the polo team had shifted to Randolph Field, although its members continued to come from all the local Air Corps fields. The first game on the new field took place on May 19, 1937. Perhaps it was the absence of Beverley, a superb ride and goal-scorer, but this Air Corps team was trounced soundly by the San Antonio club team, 6 to 1. The "Glory Days" of Kelly's polo team were over, and within a few years, polo itself began to disappear as the Army and the Air Corps moved away from the equestrian arts toward the harsher arts of war.

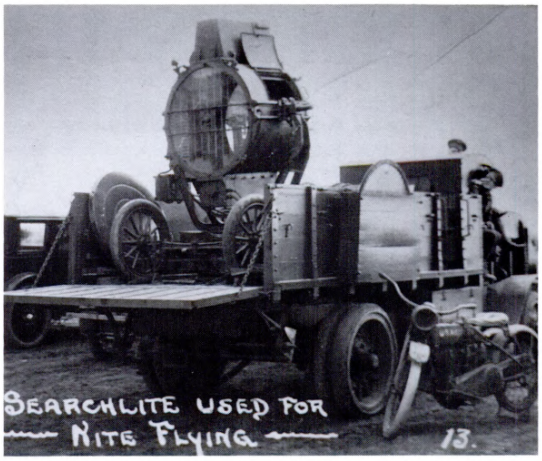

In the 1920s, flying cadets were identifiable by the white band on their caps and a blue armband carrying aviation insignia embroidered in yellow-orange thread.

Whatever cadets had to say about their instructors, officers, or Kelly in general, they all agreed that the food was good. Future General George Beverley recalled Sunday breakfast with particular nostalgia--as did LeMay--while Beirne Lay recalled lunches of "the tenderest of steaks...chicken, duck, or broiled lobster, and...a profusion of all the fresh vegetables in the seed catalog." The cadet's mess at Kelly was, he wrote, "the gourmet's millennium, the promised land." During the Depression, this kind of food was an added benefit.

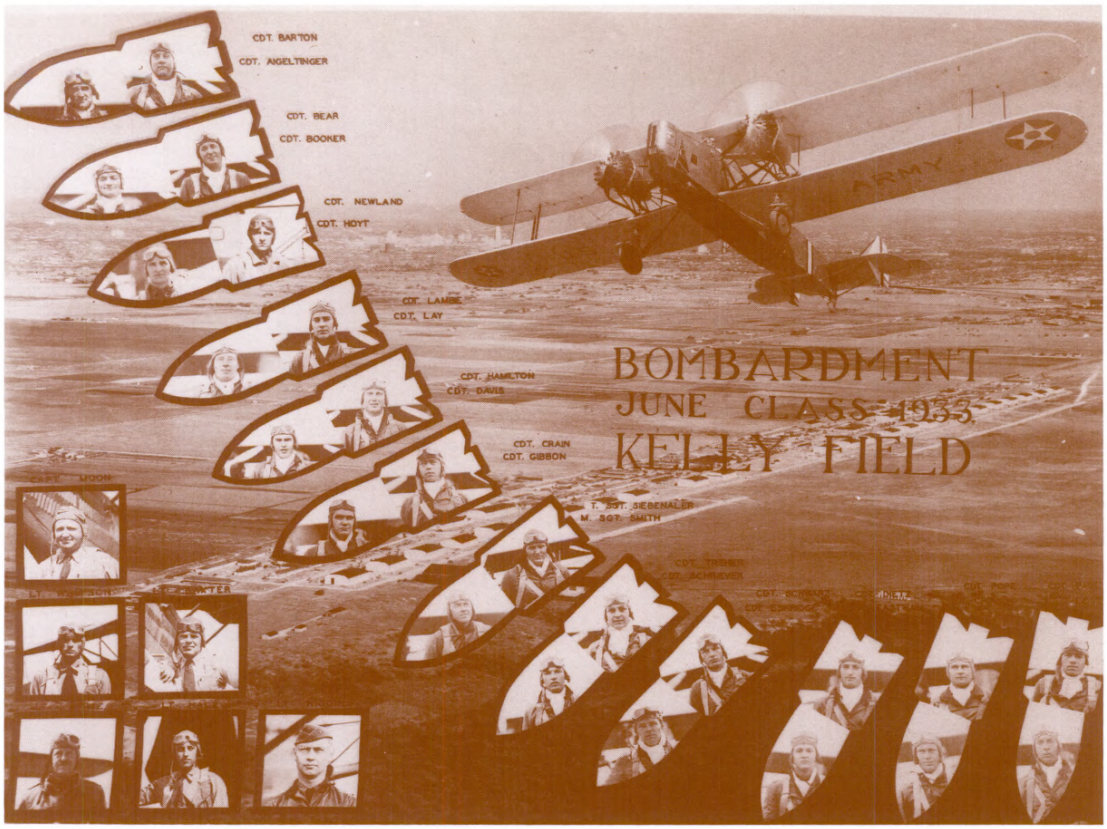

On the Flight Line

Flying was, of course, the reason they were there, and cadets enjoyed their time in the air most of all. In addition to flying the aircraft of their specialty, cadets had the opportunity to fly the aircraft of the other sections, too. Lay recalled the nimble P-12 pursuit plane with particular affection. Cadets ended up in one of the four specialized sections partly through choice and partly on the basis of evaluations made by their instructors during basic flight training. Lay chose bombardment because he thought it would help him get a flying job with an airline; he took great pride in controlling the twin-engine Keystone bomber, "learning within six inches where the wheels were on a landing, even though we sat twelve feet above those wheels." Freyer ended up in the attack section, but found flying the bombers "a lot of fun." Cadets, however, almost universally acknowledged that pursuit was the most glamorous specialty.

Advanced students did get some actual experience with bombs and guns, although only a handful of the training aircraft were ever armed. Armorers in Hangar 16 reinstalled the guns for specific training exercises, but Donald Herbert, who served in the armament section in 1940, recalled that no loading of live ammunition took place at the field. During the early 1920s, the empty fields immediately west of Kelly served as a bombing range, but the "bombs" dropped there were mainly inert training bombs. A few did contain picric acid explosives, though, and

Night flying technology in the 1920s and 1930s forced pilots to rely on their skills and instinct.

Cadet Beirne Lay, Jr. graduated with the Bombardment Section in June 1933.

during construction of the San Antonio Aviation Cadet Center on the old range in 1941, Herbert had the unenviable task of supervising the recovery and disposal of the munitions found in the area. By the 1930s, though, the Air Corps used a range at Matagorda Island off the south Texas coast for gunnery and bombing practice. To provide some training in "leading" a moving target, the Air Corps used a skeet range, a practice which began during World War I. Herbert recalled that each pilot was authorized some 600 rounds of twelve-gauge ammunition annually, and just before bird or duck season the range would be crowded with eager shooters--including most of the base staff officers and instructors.

Vagaries of Navigation

One of the consistent features of advanced training was cross-country flying, often at night. George Beverley, an instructor in 1930 who would return to command Kelly at the end of World War II, recalled leading groups to Love Field near Dallas during the day, eating supper, then, at dusk, having the students take off individually for a return to Kelly after dark. The students could rely partially on their compasses, but their primary route indicators were lights on the highway and beacons at the various emergency fields along the way. "The landing lights at Kelly were very primitive," recalled Beverley, "but we managed to get by with very few accidents and no casualties among the students."

Flying Cadet Freyer was considerably less sanguine. Writing to his mother shortly before his first night cross-country flight, he tried to ease her mind by telling her not to worry, but at the same time glumly assuming that "some of us [will] get lost and have to land somewhere before our gas runs out." He explained that they all had flares and wing lights, but closed that portion of his letter by talking about his parachute; sentences that were undoubtedly less reassuring than he intended. Fortunately, eight days later he was able to write that the two-hour flight from Galveston had been utterly uneventful.

Things did not always go so well. Cadet Royal Leonard, a pursuit graduate in 1928, wrote about a cross-country flight to Fort Clark, Texas, in which a number of cadets strayed over the Mexican border. "Out in those wild mountains," he wrote, "it takes some pretty good navigation to find it." His own navigational difficulties on another flight were ascribed to a faulty compass. Fortunately, it was still daylight, and Leonard could finally land and ask a nearby farm family where he was. Beirne Lay, Jr. remembered awakening one morning to find the entire observation section lost on an overnight flight from Galveston. As it turned out, a strong cold front came through that night, and to save money the airline beacon line between San Antonio and Austin had been turned off. Luckily, no one crashed. Many had come down on emergency fields. A pair of cadets even managed to successfully fire off flares to light their way into dark landing areas. One young flyer actually ended up in Laredo, blown almost two hundred miles south of his apparent route by the strong northerly wind.

Mishaps and Tragedies

Training aircraft of the late 1920s and early 1930s were sturdier than their predecessors and equipped with more powerful and reliable engines. Yet, in many ways their steel frame construction was less forgiving in a crash than the light wood-and-canvas construction of earlier aircraft. By mid-1937, of some 2,051 cadets entering flight training at the Advanced Flying School, thirty-nine had died in aircraft accidents. One 1933 night cross-country flight from Fredericksburg to Kelly ended in tragedy when Flying Cadet Charles Rogers crashed his O-2 in fog shortly after take off. On that same flight, Cadet Lawrence Fulwider, caught in the same fog, was able to bail out safely. His escape was pure luck. Climbing to 2,000 feet, out-of-gas, Fulwider jumped and hit the ground moments after his chute opened. In the morning he discovered that he had come down, just by chance, in a small valley between two hills, both of which peaked at over 2,000 feet.

"It could be as cold and hard as ice."

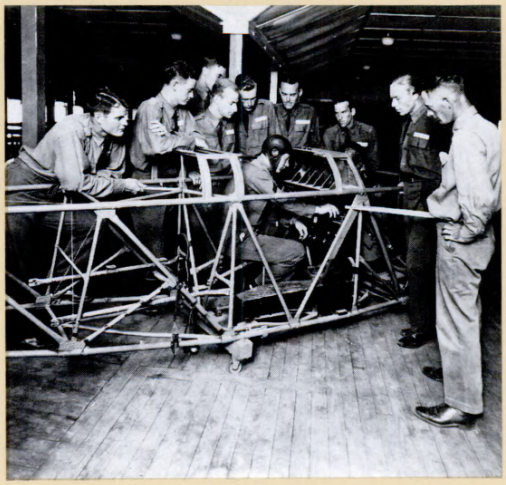

Flying was still a hazardous business in the 1930s, and most cadets knew it. Accidents occurred in nearly all classes. Many were not fatal, some were. Beirne Lay remembered a two-week period during his training when some sort of accident occurred every day. After a flight in a P-12, Lay ran into another cadet preparing to take up a P-1 pursuit. After his friend took off, Lay wrote:

> I didn't see him again until that night, when, only ninety of us now, we stood in the little chapel at Porter-Loring's. I was in the front row, and Davis lay there before us in his blue uniform, face peaceful, content. 'He must be asleep,' I thought. 'I was flying formation with him this morning.' But suddenly I knew he wasn't asleep. That he was dead. And I remembered how the Coalburner had tried to get me on Basic Stage when I gave it a chance, and I remembered how the P-12 that morning had looked like a deadly toy.

Lay was struck by the sudden realization of just how dangerous his chosen field could be. "This was no kid's game," he decided. "It could be as cold and hard as steel." But, like later generations of flyers, they had what writer Tom Wolfe immortalized as "the right stuff." After Cadet Rogers' fatal crash outside Fredericksburg, "We quickly shook off the thought [of his death], concentrating on other things, and went on with our work the next morning as usual."

Instrument Instruction

In June 1930, cadets at the Advanced Flying School began taking the first organized instruction in instrument flying available in military aviation at the order of Training Center Commander Frank Lahm. The first experiments in instrument, or "blind," flying began during the mid-1920s when Captain William Ocker developed a device called the "Ocker Box," which allowed a subject to counter the known effects of vertigo induced by spinning the subject in a chair. By 1926, Ocker had developed a hood for one of the cockpits of a trainer, so that one pilot could attempt to fly by instruments while a second could control the aircraft conventionally. Together with flight surgeon Captain David A. Myers, Ocker demonstrated the benefits of his device to numerous other pilots.

Before the appearance of simulators, cadets practiced using their instruments and radio using floor mounted partial fuselages.

Initially, though, despite confirmation of Ocker's and Myers' results by the Air Corps School of Aviation Medicine at Brooks Field, the Air Corps was reluctant to place much faith in the idea of instrument flying. Nevertheless, Ocker continued his efforts after being assigned to Brooks as an instructor in 1929. A year later, he came over to the Advanced Flying School and, with the aid of Lieutenant Carl Crane and the support of Lahm, got his ideas put into practice.

Cadet Freyer found the experience of his training interesting enough to devote a long passage to it in a letter home. With a cadet under the hood in one cockpit, an instructor took off and climbed to between 1,000 and 2,000 feet. The cadet then attempted to fly a straight and level course using a crude turn-and-bank indicator, a compass, and the air speed indicator as his guides. Over time, the cadet would learn to make turns, correct spins, and make other maneuvers, culminating in a flight along a triangular cross-country course completely on instruments. By this time, Ocker and Crane, using a gyroscope provided by Elmer Sperry, were conducting experiments in radio ranging and instrument flying. At Mitchel Field, New York, Major Jimmy Doolittle had made a complete flight--taking-off, flying a set course, and landing--entirely on instruments.

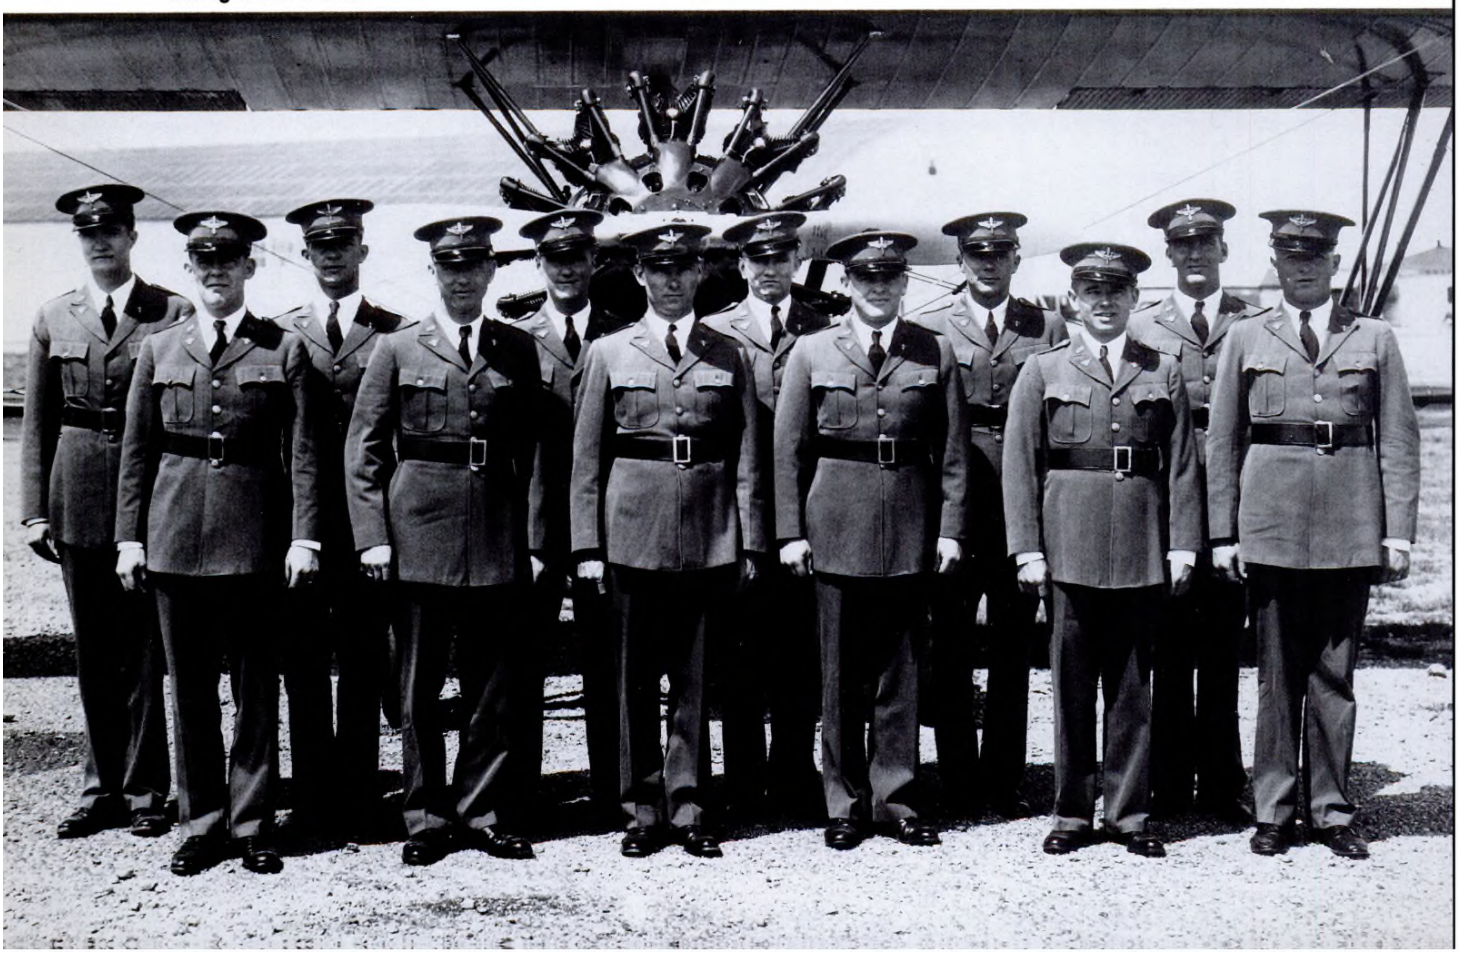

Vital as these first steps were, it was not until the Air Corps attempted to deliver the mail in 1934 that the need for even more instruction in instrument flying was evident. And, even after that humbling experience, progress in instrument flying prior to World War II was painfully slow. Nevertheless, the short time cadets at the Advanced Flying School spent aloft "under the hood" represented the first instrument flying curriculum at any military flying school in the world.

Looking the Part

Unmilitary in many ways, the cadets were proud of their uniforms. The 1920s and 1930s were the final heyday of a more formal, dressier uniform that was certainly uncomfortable, but made even the most unprepossessing soldier look, and feel, like a hero. The cadet uniform consisted of a medium blue blouse and trousers, in a shade grayer than modern Air Force blue. In many ways it resembled the contemporary British Royal Air Force uniform. Cadets wore a dark gray shirt on most occasions, white on dressier ones. The uniform blouse was belted with either a separate black leather belt or, near the end of the decade, by a sewn on cloth belt which matched the blouse fabric and color.

One sure sign of impending graduation was the acquisition of the regulation olive Army officers' uniform, a process that quickly assumed epic proportions. "No debutante," wrote Lay, "at the dressmakers before her coming out party...could have been more finicky than we." Cadet Fred Freyer wrote, after buying most of his uniform: "Can't wait to officially wear it." Blouse, shirts, breeches, cap, and boots were all custom tailored. Together with the regulation Sam Browne belt, sword, and other hardware (including spurs and insignia), the ensemble cost anywhere from $165 to $200 or more--a hefty sum considering that a cadet's pay was $75 a month. (An active duty 2nd Lieutenant made only $207 a month in the early 1930s, so a full-dress uniform was a considerable expense for officers, too.) Most cadets, said Lay, involuntarily saved for the outlay with the Air Corps deducting $20 from their pay each month through most of the year of their training.

Cadets of 1937 cut a dashing figure in their slate-blue uniforms. This uniform was replaced by an olive-drab combination during World War II.

Colonel Carl J. Crane

Carl J. Crane, a native of San Antonio, Texas, entered the Air Service as a second lieutenant on June 15, 1924. Following flight training at Brooks Field, he graduated from Kelly's Advanced Flying School in September 1925. After a tour with the 1st Pursuit Group at Selfridge Field, Michigan, Crane served as a flight instructor at Brooks, Kelly, and Randolph Fields. While at Kelly, he served as a technical adviser and pilot during the filming of the silent motion picture classic "Wings."

Working with William C. Ocker, Crane paved the way for the initial adoption of instrument flying textbook, "Blind Flight in Theory and Practice," published in 1932. While at Wright Field in Ohio, Crane designed, co-engineered, and, on August 23, 1937, test flew the world's first fully automatic landing system, earning the Mackay Trophy and Distinguished Flying Cross for this accomplishment.

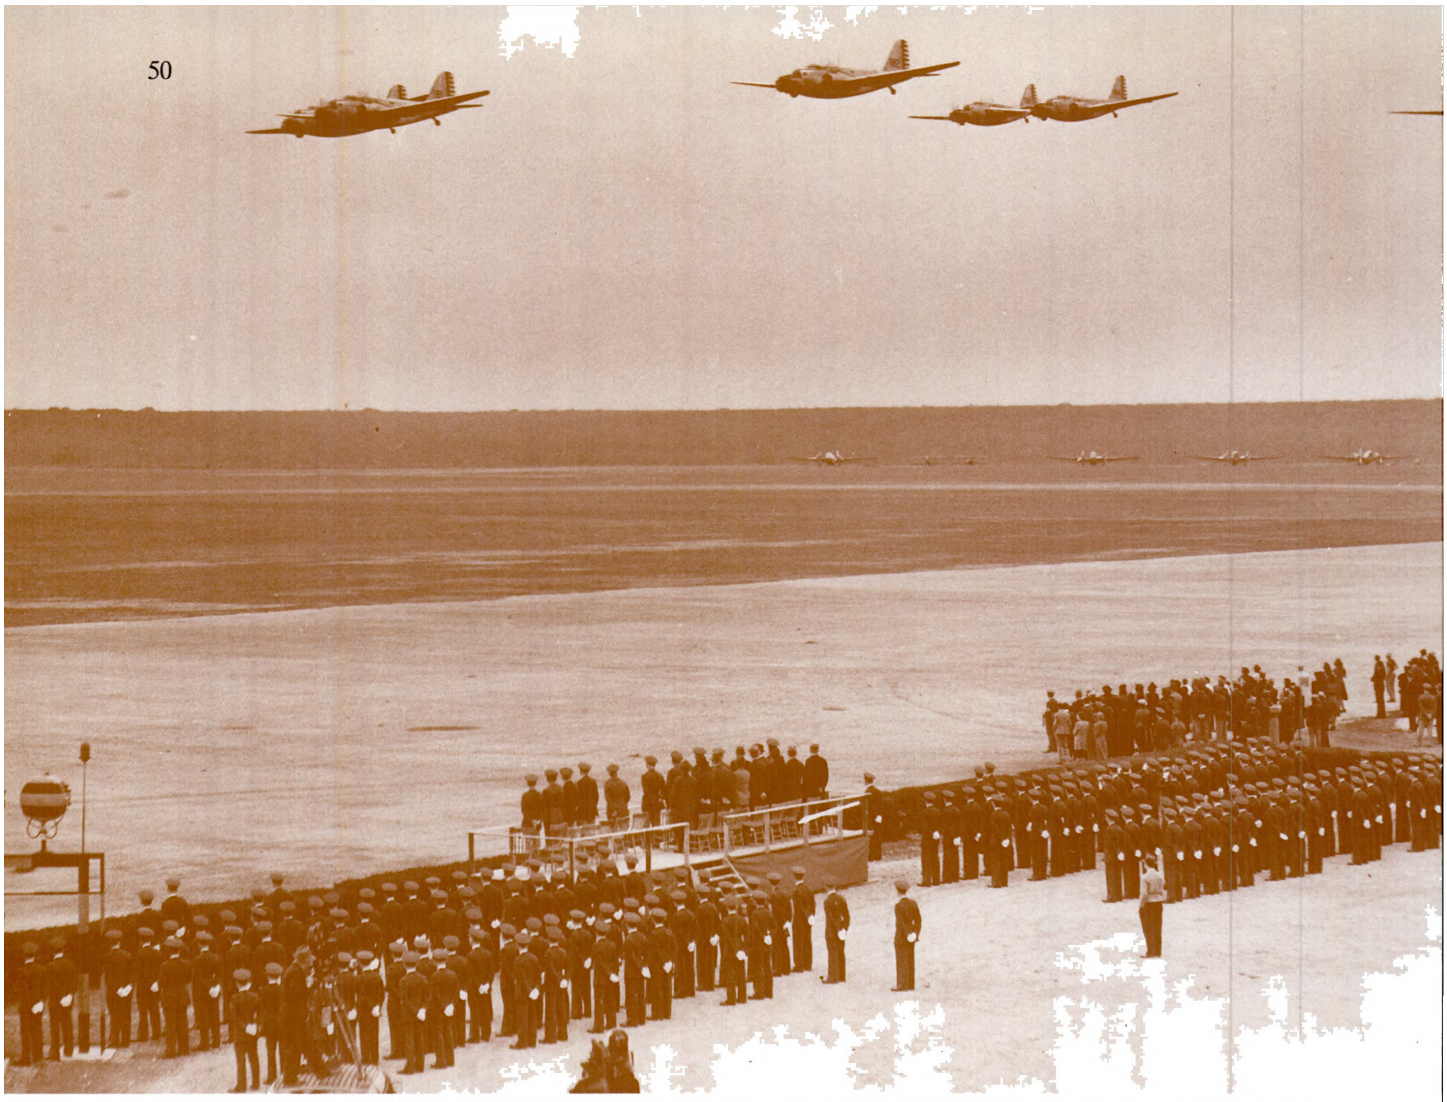

Throughout his long and distinguished career, Crane flew with almost every experimental and production flight data display during his day and held over 100 patents of aviation instruments. Colonel Crane retired in 1949 but continued active studies in research on flight control and guidance instrumentation. He died in 1982.

Colonel William C. Ocker

William C. Ocker joined the Army in 1988, joining the Aviation Section of the Signal Corps in 1912. His flying career began as a corporal at North Island, California, where he served as an aviation mechanic at the Army's flight school. In appreciation for his mechanical assistance, Curtiss instructors taught him to fly, and Corporal Ocker qualified for his pilot's license in 1914, becoming one of the first enlisted pilots.

Commissioned during World War I, Ocker became deeply concerned with the high fatality rate of his fellow pilots. Convinced that many of these deaths were due to a lack of instrument flying skills, he set out to improve flight safety. He was the first pilot to associate vertigo and disorientation with "seat of the pants" flying in poor visibility. Working with fellow "blind flying" enthusiast Carl Crane, he crusaded long and hard to convince Air Corps leaders to incorporate instrument flight instruction into the flying training curriculum. Ocker was the first to flight test Dr. Elmer Sperry's original bank and turn indicator and used it to build a "Vertigo Stopper Box." He was also the first to devise and test a canvas cockpit enclosure, making it possible to conduct "blind flying" experiments safely.

William Ocker died in 1942, having witnessed the acceptance of his theories and their inclusion into the training program at the Advanced Flying School.

The aerial pass-in-review was one of the highpoints for spectators at graduation ceremonies. This review took place during the graduation of February 1939. The aircraft are Martin B-10s.

Graduation

Graduation and commissioning ceremonies were impressive. Invitations were carefully printed, often including a photograph of the field. The day before, each class gathered for a formal group portrait. Even at this point, cadets might still fail to graduate. LeMay remembered one member of his class who was ordered to leave for violating flying regulations the night before the ceremony, but this was a rare occurrence.

The high point of the graduation exercise during most of the 1930s was the fly-by, in which all the sections roared past the reviewing stand. The bombers came first, in stepped up three-plane Vs, the first trio only a few feet off the ground. Then came the pursuit planes, followed by the attack section, and finally the observation section. An hour later, the class, most in brand-new uniforms, with brass gleaming, assembled for an address from the Chief of the Air Corps. At the end of the general's speech, the flying cadets came forward, one at a time, to receive their wings and commissions. A lucky handful would go on to active duty careers. Since regular officers completing the course had first call on available flying slots, many of the former cadets soon found that they were in the relative obscurity of the reserves. For all of them, though, the year of tension was over.

Organizational Changes

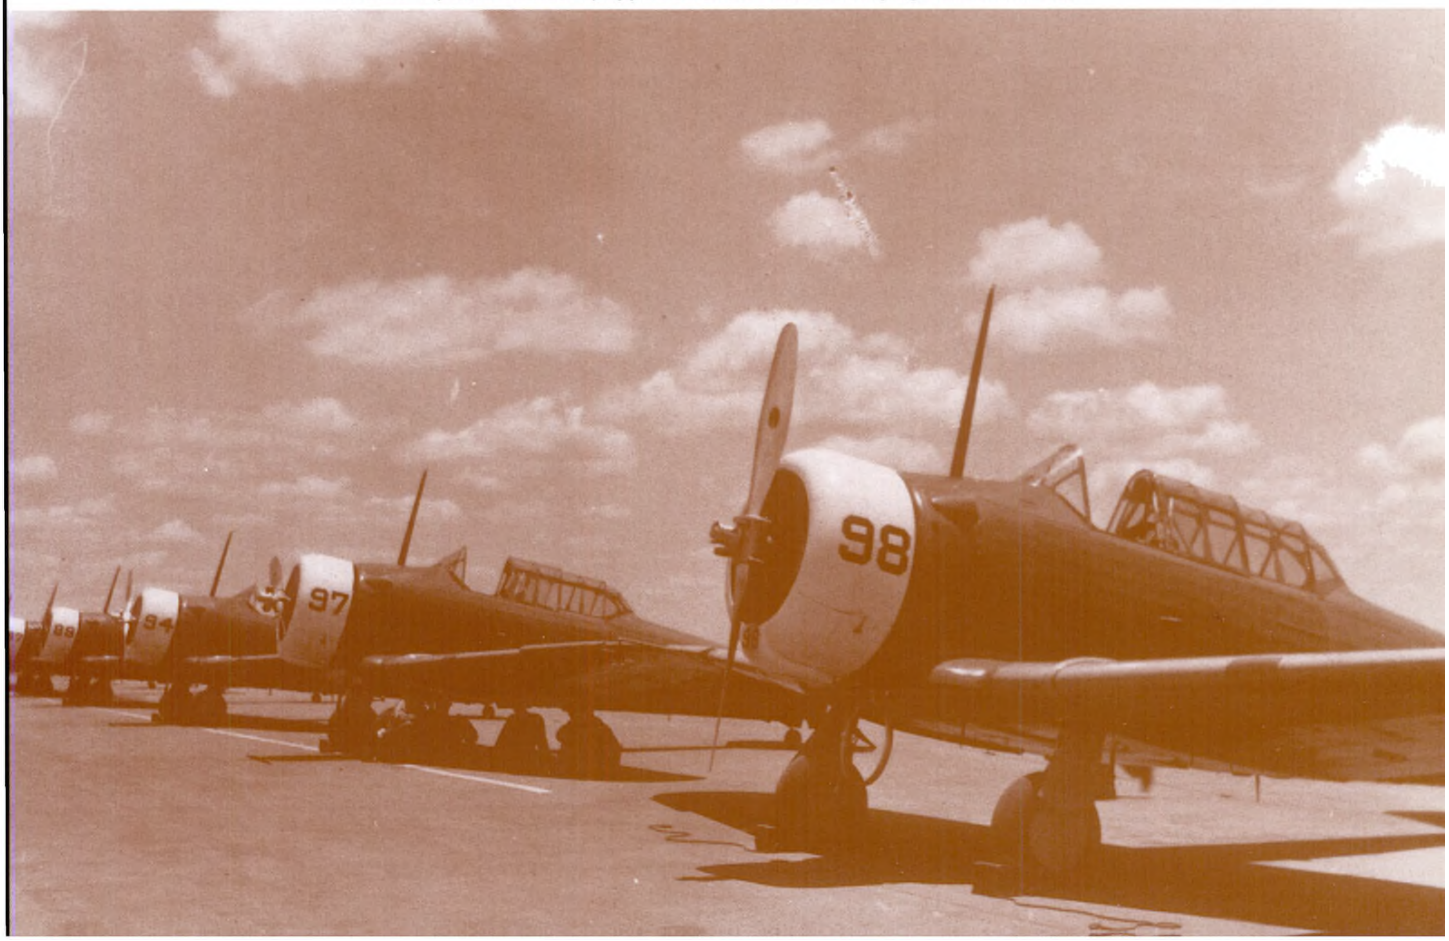

The organizational structure of the Advanced Flying School changed several times in the 1930s as the Air Corps grappled with depression-era budget restrictions followed by expansion during the last

years of the decade. From the mid-1920s, the Army planned to place all flying units under an organization known as General Headquarters Air Force (GHQ AF) if war broke out. However, it was not until the early 1930s that GHQ AF existed as more than an amorphous "paper" organization. However, at the persistent urging of senior Air Corps officers, the Army created a provisional headquarters GHQ AF as a peacetime organization in 1933, making it a permanent part of the peacetime Army on March 1, 1935.

The new GHQ AF controlled all Army tactical units, which were organized into three wings and an airship group. The Air Corps continued to supervise the logistics and training functions--including the Advanced Flying School at Kelly as part of the 24th School Wing. The squadrons at Kelly lost their school designations, but kept their numeric designations. The 43rd School Squadron, for example, became simply the 43rd Pursuit Squadron, GHQ AF on temporary duty at Kelly Field. A year later, though, on September 1, 1936, the 39th through 43rd squadrons were inactivated and reassigned to GHQ AF. Replacing them at the Advanced Flying School were four school squadrons, the 61st through 64th. At the same time, the Air Corps inspector general suggested that specialized bombardment training end in anticipation of a single course of instruction at the Advanced Flying School, utilizing a single "all purpose" trainer. General Frank Andrews, Commander of GHQ AF, supported a policy under which new pilots headed for bomber units would spend a year or more flying pursuit or attack aircraft with tactical units before heading to a bomber unit. However, some specialized training in bombardment continued at Kelly until June 1940, when all specialized training at the Advanced Flying School ended.

The argument in favor of ending specialized bombardment training at Kelly was based in part on a renewed emphasis on the role of the bomber in Air Corps doctrine, and in part on the aging aircraft used for bombardment training at the school. By the mid-1930s, the slab-sided, twin-engine, biplane Keystone and NBS bombers flown with such pride by Beirne Lay were wholly obsolete. In 1934, the Air Corps began taking delivery of the Martin B-10, an all-metal, twin-engine, monoplane bomber with a power turret in the nose. Three years later, the Douglas B-18, a derivative of that company's DC-2 airliner, began to enter the inventory. Even as the twin-engine

The BC-1 (Basic Combat-1) appeared at the Advanced Flying School in 1938.

The rugged BT-8 was flown at Kelly from 1936 through the end of the decade.

B-18s appeared, Air Corps officers were excited by the possibilities of the four-engined Boeing XB-17.

During these years, however, few changes took place in the aircraft flown at Kelly's Advanced Flying School. For most of the 1930s, pursuit students continued to rely on the nimble P-12, although a few P-26As appeared at the field during the middle years of the decade. The Air Corps also began acquiring the Seversky BT-8 trainer in 1935. This was the first monoplane trainer used by the Air Corps, but it was in no way an advanced pursuit trainer. (Retired Colonel T. E. Gurnett, a 1938 graduate, recalled the pairing of the P-12 and BT-8 as "quite a combination, a feather and a truck." The BT-8 was, indeed, a rugged aircraft. Gurnett described one incident in which a cadet literally flew into a hangar, which tore off his fixed landing gear, and pancaked onto the landing field. The cadet walked away with only a small scratch.)

Bombardment students also had to rely on older models, as did attack and observation students. The Keystone LB-5s and LB-6s flown by Lay were still in use as late as 1938. (Kelly managed to obtain a pair of B-18 bombers in 1938, and two Martin B-10s were also at the field in 1940. The latter were not, however, used for training; they served as target tugs during air gunnery practice.) Attack students flew A-12 "Shrikes" dating from 1934, and observation students flew the O-25, a two-seat biplane variant of the Douglas O-2 dating from the late 1920s. By 1937, though, things began to change. The shift was gradual at first, but within two years the field so many flying cadets recalled with fondness would be in the midst of an expansion program that would leave it almost totally transformed.

The nimble P-12 was the last biplane pursuit used by the Air Corps.

Flying Events and Extravaganzas

Air Service enthusiasm for exciting, crowd-pleasing aerial displays continued throughout the 1920s, a decade in which public interest in aviation grew steadily. To some extent, the air shows and demonstrations of the 1920s reflected the same desire to lure in new recruits which had motivated the "air circuses" of the immediate post-war years. But, Air Service, and later Air Corps, pilots were also among the nation's leaders in pushing the frontiers of flight forward during these years, and aerial displays of flying skill served as reminders of the contributions and skills of America's military flyers.

As one of the centers of Army aviation, Kelly Field naturally played host to a number of such air shows. One in 1923 featured acrobatic displays by pursuit pilots, parachute jumps, and an aerial refueling demonstration, along with displays of aircraft. During the show Lieutenant Wagoner died in the crash of his plane.

This tragedy did not prevent the field from hosting another display in April 1924, featuring the start of that year's National Elimination Balloon Race. Held in conjunction with the annual Fiesta Week, the race was to select an American team to compete in the International Balloon meet in Belgium for the James Gordon Bennett Cup. Along with the balloon race, Kelly Field pilots participated in a series of aerial displays, featuring air races, parachute jumps, and a massive aerial review. Participants included Major Lewis H. Brereton (who was in charge of the military police detail for the meet and would later command American forces in the Pacific during World War II), Major Frank Andrews (executive officer for the meet), Edgar G. Tobin (assisting in the coordination of the flying events), and Lieutenant Clements McMullen (who would serve as Kelly's commander in the 1940s and again in the early 1950s.) Over 74,000 people took advantage of reduced railroad rates and the good weather to visit the field. Although hopes that the race would break the existing distance record for free-ballooning went unrealized, W. T. Van Orman of the Goodyear Tire and Rubber Company, traveled 1,072 miles, landing five miles south of Rochester, Minnesota. The leading Army team, headed by Major Norman W. Peek, landed five miles south of St. Ansgar, Iowa--1,021 miles from Kelly.

Trans-Continental Efforts

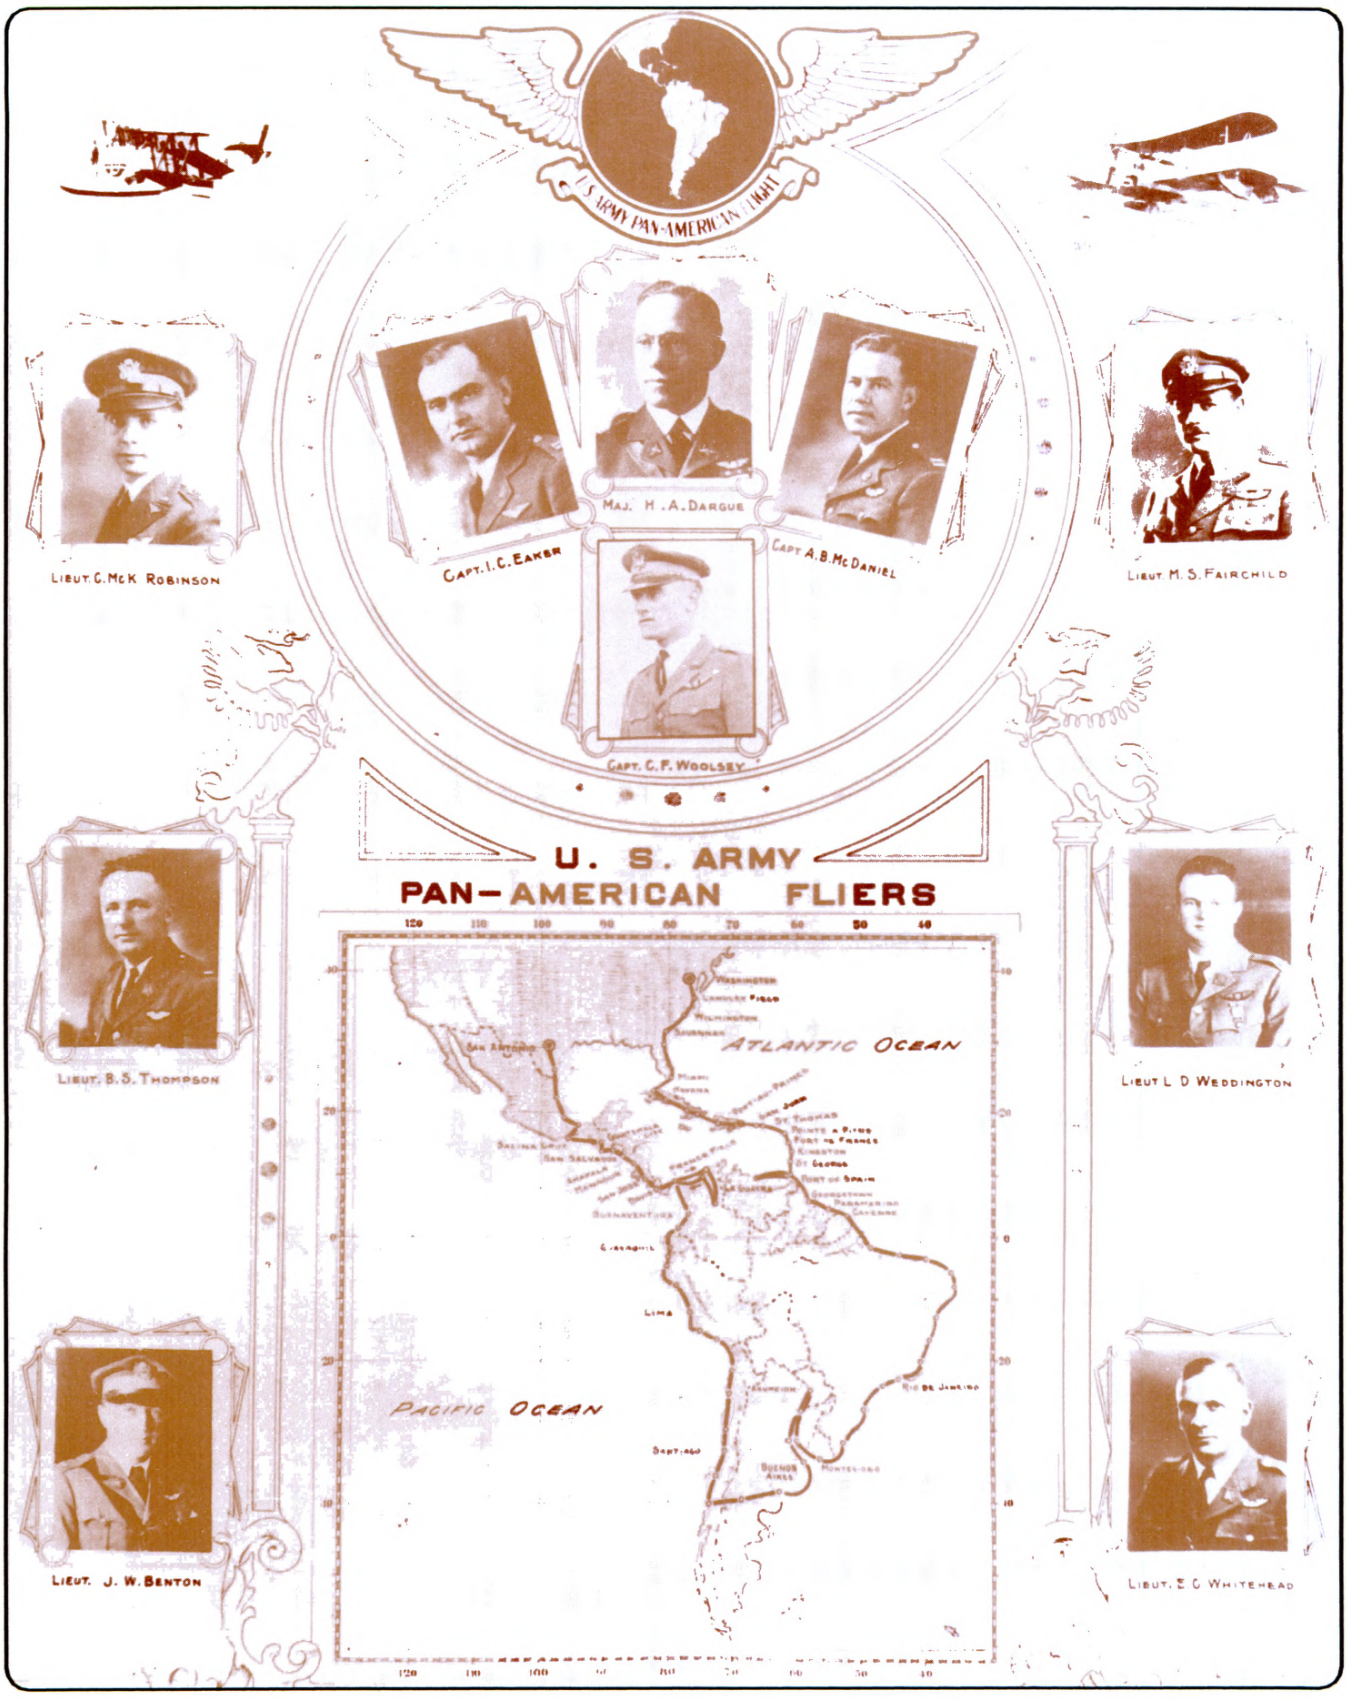

Air Service pilots were among those excited by the challenge of flying faster and farther with each improvement in aircraft speed and reliability. This urge dovetailed neatly with Air Service interest in finding out how quickly aircraft could be shifted between locations.

Beginning in 1921, a pair of Air Service flyers attempted to fly from western bases to the East Coast. Lieutenant Alexander Pearson, flying from Jacksonville, Florida, to San Diego, California, came down with engine trouble along the Rio Grande. Lieutenant William Coney also suffered engine trouble while crossing Texas, but eventually reached Florida with only twenty-two hours and twenty-seven minutes of actual flying time--a record at the time.

In August 1922, Lieutenant James H. Doolittle, already famous throughout the Air Service as a daredevil, made an attempt to break this record. In contrast to his reputation, Doolittle made careful preparations, flying the route beforehand to check landmarks and rebuilding his DH-4 at McCook Field, Ohio, and Kelly Field. After a propeller failure ended a first attempt, Doolittle tried again in early September, taking off from Jacksonville and landing twenty-two hours and thirty-five minutes later at San Diego. His only stop was at Kelly, where he spent only eighty-five minutes for fuel and service.

Pan American Goodwill Flight

After a successful around-the-world flight in 1924, the next major international tour was the Air Corps Pan American Goodwill Flight in the spring of 1927. Publicized as an effort to demonstrate the feasibility of commercial air transportation, as well as the progress of aviation within the United States, the flight also demonstrated the reach of American military airpower. Five Loening OA-1A amphibian aircraft left Kelly Field on December 21, 1926, bound for Panama. Over the next several months, the airmen visited twenty-three Latin American countries, bearing a greeting from President Calvin Coolidge. Breakdowns plagued the flight, though, and a mid-air collision over Buenas Aires killed two of the team members. The flight returned to Bolling Field, outside Washington, D. C., on May 2, 1927, met by an enthusiastic crowd. Whatever public relations benefit the flight had for the Air Corps was, however, fleeting. Public attention was already focused on the pilots and aircraft gathered at New York to challenge the Atlantic, and Lindbergh's triumphant solo flight on the night of May 20-21 totally eclipsed all news of the Goodwill Flight.

The excitement of "Wings" was partly due to innovative aerial photography.

Hollywood Comes to Kelly

For the people of Kelly, the high point of the late 1920s was undoubtedly the arrival of a crew from the new national film capital of Hollywood to cinematically recreate World War I for the epic silent picture "Wings." The choice of Kelly as a central location made good sense. Not only was the field the most important site for flight training during the war, it was still home to the Advanced Flying School. A large pool of skilled instructor pilots was available, both at Kelly and nearby Brooks Field. In addition, Fort Sam Houston was only a few miles away, and the soldiers of the 2nd Division were available to participate in battle-scene filming at the Leon Springs training ground (now known as Camp Bullis).

Far from reluctant to cooperate, the Air Corps made planes and pilots available to director William Wellman on a lavish scale. A few pilots and aircraft came from the 1st Pursuit Group at Selfridge Field, Michigan, including a young lieutenant named Carl Crane (who would later, with William Ocker, help formulate the first instrument flying curriculum for the Air Corps). These men and planes served as "Germans" during filming. Dozens of others from all over the country joined them to fly as Allied airmen. A handful of the best "doubled" for the leading actors in aerial scenes. Future General Hoyt Vandenberg, then an instructor at Brooks, was one of them, as were E. J. Rogers and Earle Partridge; who both retired as general officers.

For some scenes, these men sat in the front cockpit of a trainer, operating a camera mounted over the cowling and ducking down when it was on so that the actor in the rear cockpit was visible "piloting" the plane. In another scene, Vandenberg simulated being shot down, triggering the camera and releasing a bag of soot to resemble smoke. In this case, Vandenberg dumped the entire contents, blinding himself. As he struggled to breathe and clear the cockpit from the choking dust cloud, his plane veered all over the sky. Luckily, Vandenberg recovered control before crashing. The film crew was jubilant; as he climbed down, still gasping for air, Vandenberg was eagerly asked if he could do it again. Other pilots were not as fortunate. During filming of the climactic scenes recreating the battle of St. Mihiel, one pilot was killed in a crash; and Wellman remembered another pilot crashing when, caught up in the drama

"I Wanted Wings" offers some of the last remaining footage of activities along the old Kelly flight line.

The film crew stayed on location for several weeks waiting for clouds to appear, with Wellman taking charge of tackle football games on the concrete parking ramps against teams from Kelly, Brooks, and Fort Sam Houston. Finally, though, the weather cooperated, Wellman got his scenes shot, and the men and planes could return to more normal duties. "Wings" premiered in San Antonio in July 1927 and was shown nationally throughout 1927 and 1928 to rave reviews. In May 1929, it won the first academy award for best picture; the only silent film ever so honored.

Although Kelly played no major role in aviation events of the 1930s, it once again played host to Hollywood in the fall of 1940 for the filming of Beirne Lay's screenplay of his memoir "I Wanted Wings." Large portions of the film were shot at Randolph Field, following the progress of class 40-D. Later scenes were shot at Kelly, incorporating the mass fly-by of the graduating class. Like "Wings," "I Wanted Wings" premiered in San Antonio (in March 1941). It, too, received high praise from film critics, became Paramount's top-grossing film of the year, and was honored by an academy award--in this case for special effects.

Expansion and Growth

The Air Corps willingly provided cooperation in the making of "I Wanted Wings" out of the same desire to spur recruiting efforts that had motivated the aerial shows of the early 1920s. By 1940, Kelly was in the midst of an expansion that was transforming the entire Air Corps as part of a national rearmament program to meet the emergent threat of Nazi Germany and Imperial Japan.

The need for improvement was evident by 1937. Many of the facilities, including nearly all the hangars, barracks, and offices, dated from World War I. Dilapidated and worn, they were, in the words of the Air Corps Inspector General, "on [their] last legs." Old age, dry rot, and the ravages of ants and termites made many of the hangars, too small in any case, hazardous.

Some improvement was already underway. Although funds allocated to the Works Progress Administration (WPA), a New Deal public works relief program, could not be used to purchase supplies or machinery, they could be used for the construction

of buildings. While some funds went toward temporary reconstruction of older buildings, the most visible result of the WPA's presence at Kelly was a miniature range building completed in May 1937. Although for years rumors abounded that the structure was a "bombing tower" for the instruction of bombardiers, the truth is more prosaic. Octagonal, eighty-five feet high, and sixty-three feet across, the hollow-cored building had a revolving terrain map with hundreds of small light bulbs at the bottom. Metal balconies circled the inner core at three levels. Student observers sat at small desks on the balconies, each student with his own morse key. As the miniature terrain slowly revolved below, instructors triggered a prearranged sequence of the light bulbs to simulate artillery or bomb explosions. The students then telegraphed what they saw, with the instructors rating them on the accuracy of their observations. It never served as a training aid for bombardiers.

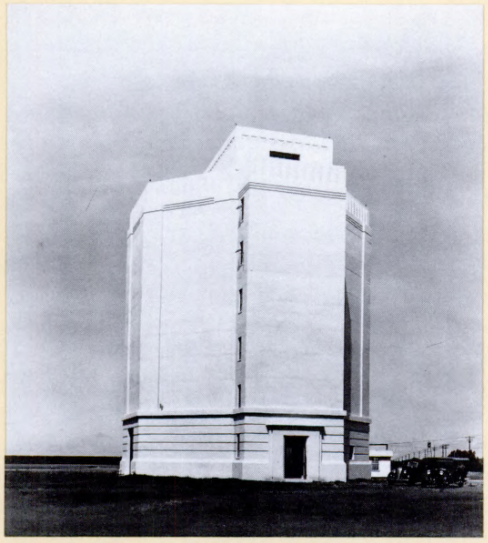

Ironically, its service as an aid for observer students was also brief. By 1937, Air Corps enthusiasm for observation had faded, replaced by the emergent doctrine of strategic bombardment built around the four-engine heavy bomber. (Even the once romantic pursuit mission got increasingly short shrift at the Air Corps Tactical School during these years.) Within two years the building was used solely to train pilot candidates in morse code, and trainees of the early 1940s cannot recall it being used at all. Today it remains a unique landmark at Kelly, mute testimony to the passing of what once was a critical mission of the Army's air arm.

Other permanent improvements to Kelly began to emerge out of funding appropriated by Congress in 1938. Brigadier General James E. Chaney, commander of the Air Corps Training Center, recommended that priority go to the construction of a barracks for enlisted men, a separate barracks for aviation cadets, a headquarters building, a set of senior officer quarters, and a row of non-commissioned officer quarters. Construction of the quarters began in July 1938, and construction of the other buildings, including a large hangar, got underway during the spring of 1939. All were complete by the middle of 1940. Fifty years later they are still in use, largely for their original purpose. The large enlisted barracks, so superior to the drafty World War I facilities, soon became known as "Buckingham Palace," and it remains "The Palace" fifty years later, still serving primarily as an enlisted barracks. The headquarters/administration building houses the San Antonio Air Logistics Center headquarters, the officer and noncommissioned officer quarters still serve as quarters, and the large hangar houses the flight operations center. The one-time cadet barracks still serves as visiting officer quarters, but also contains the officers' club.

As the erection of these permanent structures continued, Air Corps expansion went forward. Although prior to 1939 the number of new pilots graduating from Kelly never exceeded 350 in any year (and was often less than 200 per year), Air Corps planners anticipated a need for at least 1,200 pilots per year. Accordingly, Air Corps Chief General Henry H. "Hap" Arnold, initiated discussions with

In 1937, Kelly was still a rural enclave, not far removed from its pastoral origins.

The unique miniature range building was for observer training, not (despite persistent rumor) for bombardier training.

the operators of civilian flying schools in the fall of 1938, asking them to prepare to provide primary flying training for prospective Army pilots. Congress approved this step in April 1939, and the first nine schools began training Army flyers by the summer.

The outbreak of war in Europe in September added even further impetus to American military expansion. For the next two years the Air Corps, which became the Army Air Forces in June 1941, prepared a series of increasingly ambitious expansion plans which superseded each other with dizzying rapidity. In March 1940, the Air Corps submitted a revised expansion plan to the War Plans Division, calling for 7,000 pilots per year and forty-one combat groups by the end of December 1941. In June 1940, the Air Corps proposed a goal of fifty-four combat groups by April 1942, and a pilot training target of 12,000 per year. Known as the First Aviation Objective, this proposal, too, soon gave way to the pressure of events. By February 1941, the pilot training goal was set at 30,000 per year, a hundred times the levels attained during the 1930s.

A revolving three-dimensional terrain model used small lights to simulate the flashes of artillery and bomb explosions for student observers.

The impact of these plans on Kelly's Advanced Flying School was severalfold. It was clearly impossible for a single school to provide advanced training for this number of pilots, and the Air Corps began developing a network of basic and advanced schools around the country. Eventually, seventy-two new Army flying fields would exist to absorb the influx of candidates coming from civilian-run primary schools. Further, in May 1940, the Air Corps modified its existing training organization by creating two new training centers on the east and west coasts. The former Air Corps Training Center at Randolph became the Gulf Coast Air Corps Training Center--part of an eventually larger, centralized training command. Kelly's primacy as the "Alma Mater" of the Air Corps faded as it became only one of an increasing number of advanced schools.

Although Kelly no longer played a central role in pilot training, for almost two decades it had been the final stop for young men hoping to gain a commission and wings. By the end of 1940, 5,568 men became Army aviators at Kelly Field. The vast majority of the men who would lead the Army Air Forces during World War II, and later lead the newly independent Air Force, passed through Kelly. Many served at the field more than once. All shared warm memories of their days as flying cadets. All were part of an abiding part of Kelly's heritage; of a time when the sky over the field was filled by young men who just wanted to fly.

A World About to Disappear: BT-8s fly in formation over Kelly. In a few brief years, they and the mule would be obsolete and the Kelly landscape forever altered.

324

CHAPTER THREE

FOUNDATIONS OF DEPOT MAINTENANCE

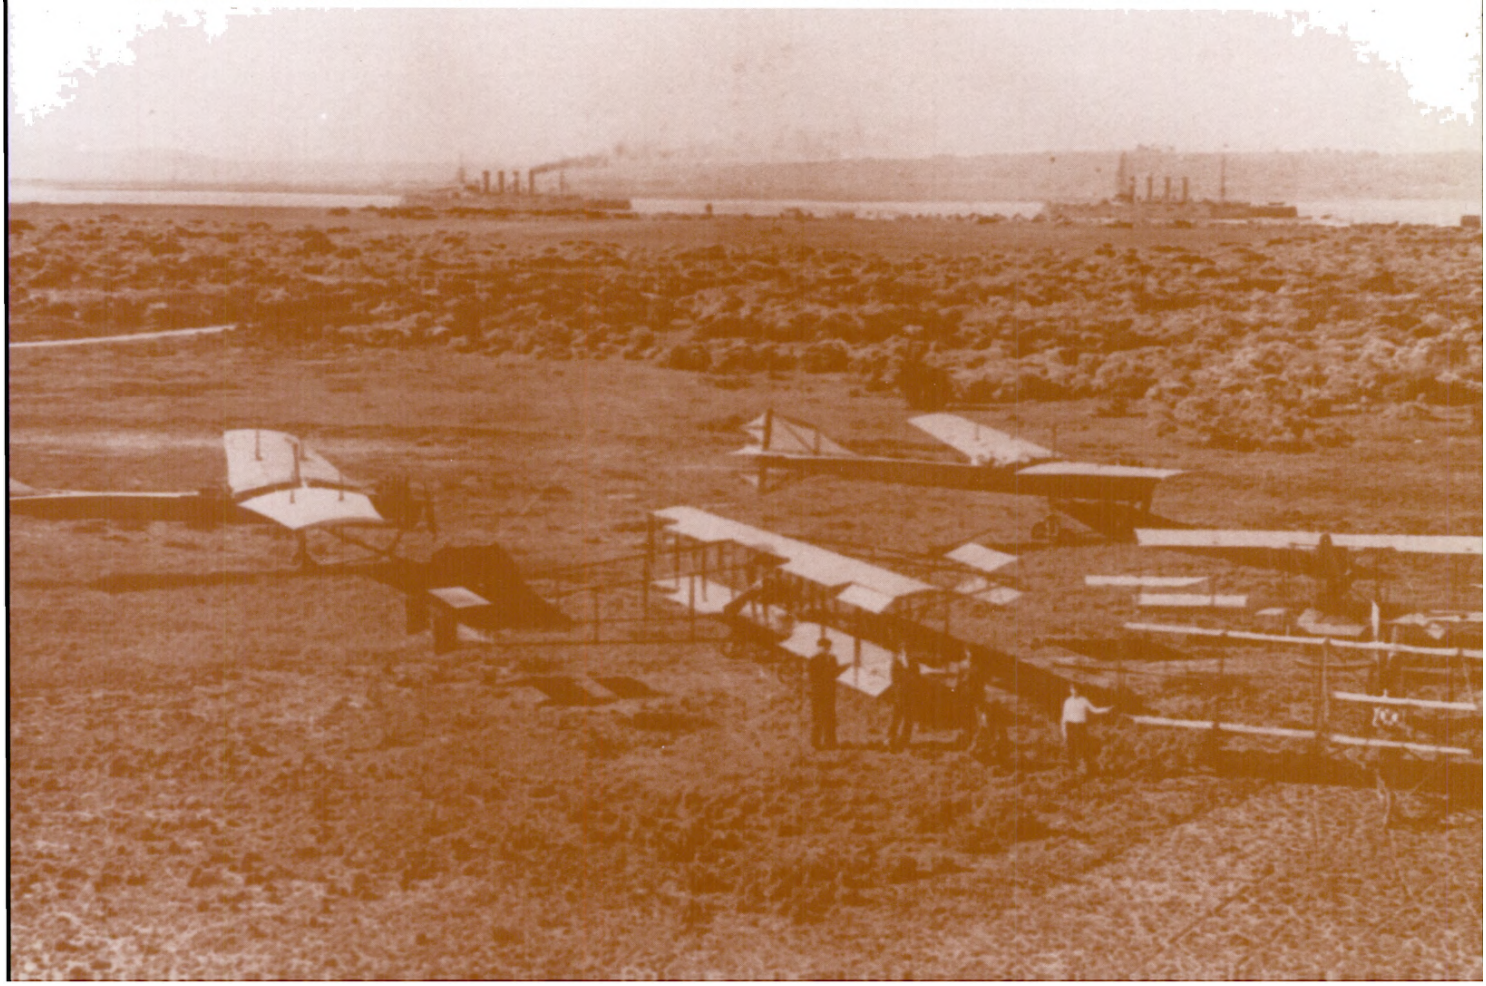

Almost from the very start, aircraft maintenance played an important role in the story of Kelly Field. Among the young pilots arriving to join the newly-created 3rd Aero Squadron at the field in the spring of 1917 was a Nebraska National Guard officer named Edgar Bagnell. A one-time auto racer, Bagnell learned to fly at the small Army training field at Mineola, New York, in 1916. Like many other flying National Guardsmen, Bagnell, nicknamed "Happy," became a member of the Signal Officer Reserve Corps--the earliest forerunner of the Air Force Reserve/Air National Guard--created by the National Defense Act of 1916.

After training at Mineola through the winter, Bagnell joined the 3rd Aero Squadron on May 11, 1917. In San Antonio, his mechanical skills made him a logical choice as the engineering (or maintenance) officer--the first man to fill the position at the new field.

Early Maintenance in the Aviation Section

The position filled by Bagnell was a relatively recent innovation within the Aviation Section. Early arrangements for supply and maintenance reflected the hazy status of Army aviation, as well as the focus on the training of pilots rather than the development of skilled ground technicians. Pilots did much of their own maintenance; indeed, Air Service General Order Number 1 stressed that if a young officer was "the sort of person who likes to keep his hands clean, don't take up aviation." Benjamin Foulois later recalled that his verbal orders to take Aeroplane Number 1 to San Antonio in 1910 had included the admonition to also "take plenty of spare parts," but found that this portion of his instructions was overlooked. No spare parts arrived at Fort Sam Houston for two months. Allocated only $150 to maintain the airplane in 1910, Foulois spent all his government

North Island (later, Rockwell Field) was the home of the first Aviation Section maintenance organization in 1914.

funds within four months, and had to contribute some $300 of his own money to keep the machine in the air.

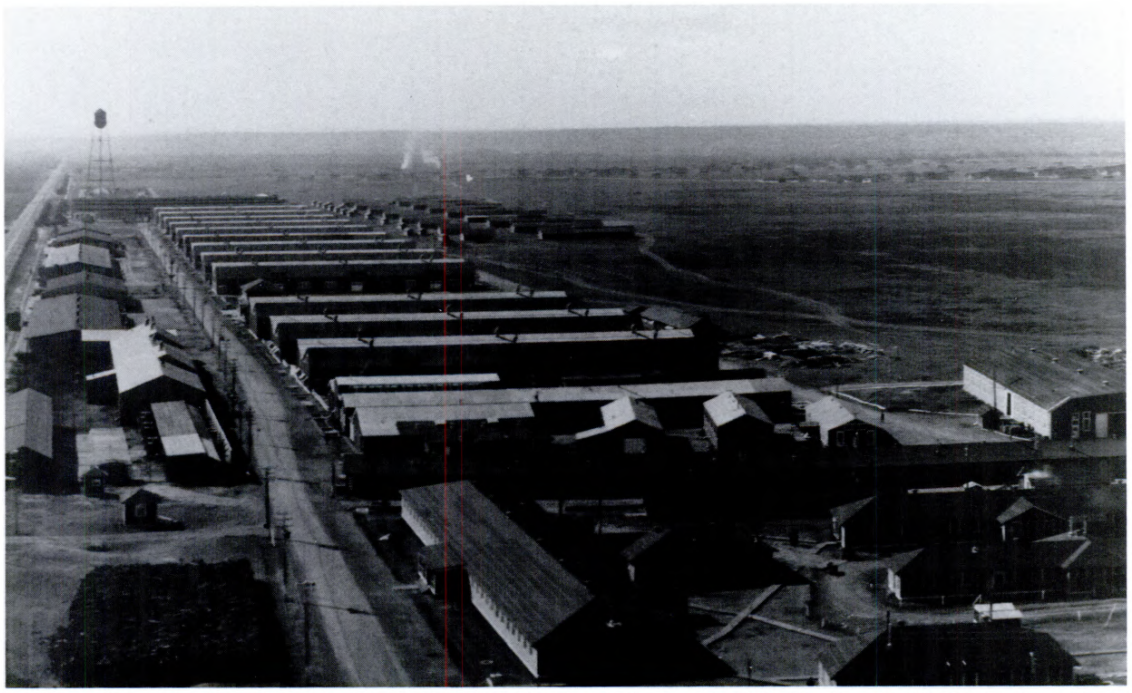

Aircraft maintenance was the responsibility of the pilot and his ground crew, assisted by representatives from the manufacturers. Foulois and his small contingent of enlisted men at Fort Sam Houston, for example, enjoyed the help of Eugene Ely of Curtiss and Frank Coffyn of Wright. And, when the Aviation Section opened its small flying school at North Island in 1913 (also the home of the 1st Aero Squadron), it could rely on the facilities and personnel of Glenn Curtiss' for a large proportion of its support. For monthly rent of $25, the Army gained the use of Curtiss hangars, tools, and machinery. Of course, the sheer mechanical simplicity of early aircraft was also a factor. The only complex item was the engine. Early aircraft had no instruments. As a guide, pilots tied a piece of string to the plane and used it to gauge their direction and drift. As Royal Frey drily points out in his survey of early aircraft engineering, this string required no maintenance.

In June 1914, the Aviation Section brought in two civilians, Grover Loening and Oscar Brindley, to restructure the training and maintenance effort at the San Diego school. Seeking skilled mechanics, they promptly hired nine civilians and established an Experimental and Repair Department, with Lieutenant Thomas DeWitt Milling as the officer-in-charge. This department took over responsibility for testing new aircraft and repairing and overhauling the training aircraft at the school. Ground crews continued to make necessary minor repairs and carry out routine preventive maintenance, while a Motor Overhaul Shop under Lieutenant Douglas Netherwood carried out engine overhauls. This new arrangement was the first attempt within the Aviation Section to institutionalize maintenance, although the men of the military ground crews still had to learn their skills "on the job."

At this point the machine shop doubled as an instructional center; a practice that cut into the time allowed for actual repair work. In mid-1915, though, the Aviation Section separated the two functions, and, for the first time, adopted a detailed set of examination requirements for "aviation mechanicians." Enlisted men of any rank could qualify for a practical test administered by a board of officers. These men repaired and maintained aircraft and engines under the supervision of squadron officers and the chief of the machine shop.

Maintenance crews at Kelly used tent hangars until more permanent facilities were built.

The first maintenance department was located on Kelly Number 1. It moved to Kelly Number 2 in 1917 but returned to the original site after the war.

Maintenance Organization on the Eve of War

As the largest tactical unit in the Aviation Section, the aero squadron carried out its own maintenance. According to War Department General Order Number 55 in October 1916, and based in part on the recommendation of Foulois after his experiences in Mexico, each squadron was to have a depot section of three officers and twenty men, but these sections did not accompany the squadron into the field. Instead, they would remain at a location in the rear where they could maintain reserve aircraft coming in from the factory and funnel supplies forward to the flying sections of the squadron. As yet, they did not serve as general repair depots. Aviation schools, three of which existed at the end of 1916, had their own maintenance organizations to repair and maintain their training aircraft. In contrast to the squadron organization, most of the personnel at a school "engineering department" were civilians, but like the squadron depots these did not serve as general repair depots for frontline aircraft. Major overhauls were still viewed as a matter for the aircraft or engine manufacturer.

"Happy" Bagnell and Maintenance at Kelly Field

Thus, there were few precedents to guide Lieutenant Bagnell as he took charge of Kelly's emergent engineering department. His racing experience, and knowledge of auto engines, was undoubtedly an important consideration in his selection for the position, but no one had yet dealt with the problems associated with running a maintenance organization amid the pace of expansion now underway.

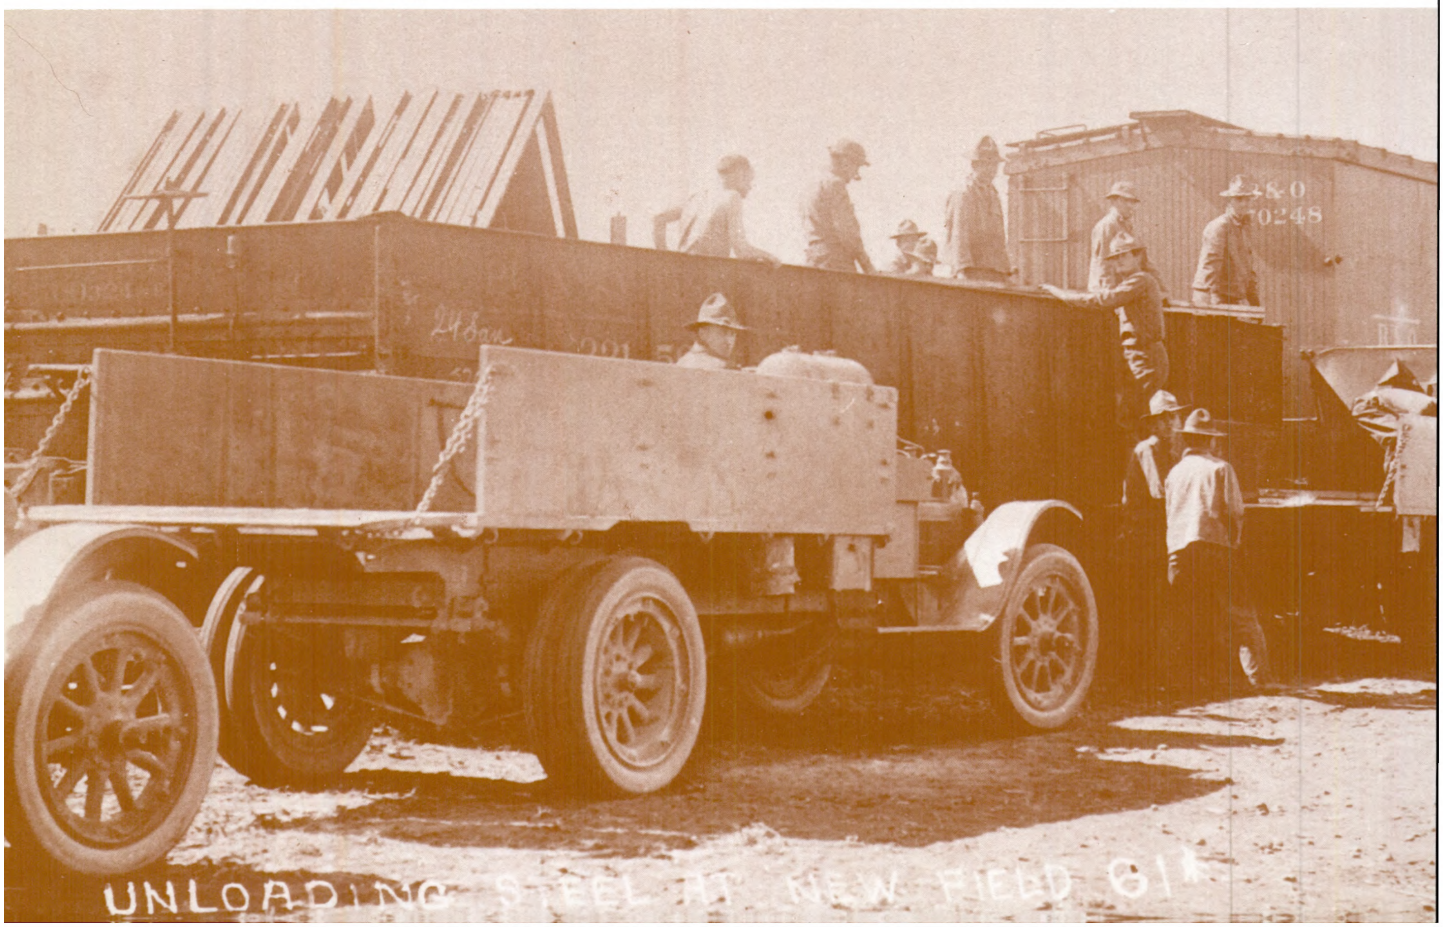

Located on Kelly Number 1 until October, Bagnell's maintenance effort was hampered during the first few months by the acute shortage of trained mechanics. Although the Air Service made strenuous efforts to attract skilled men from aircraft manufacturers and identify recruits with a background or aptitude for such work, it was not until August that enough men could be found to create a permanent maintenance squadron. Initially numbered the 110th Aero Squadron, this squadron was renumbered as the 804th Aero Squadron in February 1918 and was eventually designated as Squadron K.

During the first few months it was difficult for the ill-equipped mechanics to keep even the few available aircraft in flyable condition. For a time the field had only ten aircraft, and all were in various stages of reconstruction after training accidents. In the midst of this, Bagnell organized and carried out the abrupt transfer of his organization to Kelly Number 2 in October 1917. Given no advance warning and less than a single day to make the move, Bagnell commandeered every truck at the field and shifted every item of equipment and all his supplies (including coal) by mid-afternoon. Even as the last loads of material came off the trucks, his mechanics were back at work repairing and overhauling engines.

Within days, Bagnell was confronted with the need to construct 100 brand-new trainers--a task he accomplished only by impressing literally every enlisted man on the field into service. Episodes such as this made "Happy" Bagnell something of a celebrity; a status he added to when he unilaterally purchased several railcars of spruce lumber and a carload of steel. As it turned out, both acquisitions proved wise, but this did not stop him from facing potential court-martial charges for "injudicious expenditure" of Signal Corps funds. When no charges were actually brought, Bagnell's local reputation grew further.

Bagnell's opportunities for such individualism disappeared when the Air Service reorganized the engineering department in November 1917 and placed Major J. E. Rossell in charge. No longer the engineering officer, Bagnell took charge of the woodworking department, machine shop, welding and brazing departments, tin shop, magneto overhaul department, the vulcanizing department, and the stock and tool room. At the same time, he became head of the Field and Hangar Division, with the responsibility of overseeing the daily maintenance of the training aircraft in use. When Rossell left to take charge of flying at Gerstner Field, Louisiana, Bagnell became the engineer department inspector with two new officers sharing his former responsibilities. Major Hubert H. Harmon succeeded Rossell briefly before being assigned to Taliaferro Field. He was replaced as Kelly's engineer officer by Major L. H. Drennan, who was in turn succeeded by Major S. M. Decker in March 1918. In June, Lieutenant Bernard Cane, a one-time automotive engineer who had assisted Bagnell in obtaining the railcar of steel, took over as engineer officer until the end of the war.

Lieutenant Edgar Bagnell got into hot water by "appropriating" a railcar of steel for his maintenance operation.

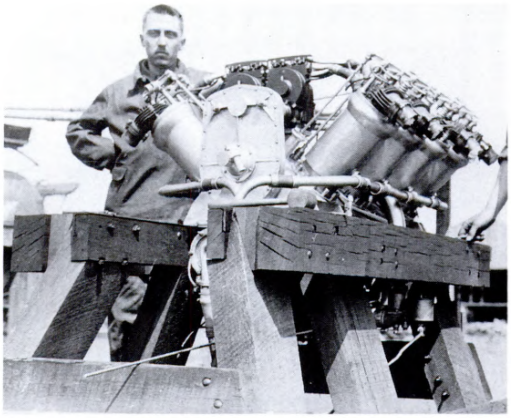

Propellers were a critical item during the early days.

Organization of the Engineering Department in 1918

By the time Bagnell, still a lieutenant, left Kelly in the summer of 1918 (disappearing into history), over 1,900 men were assigned to the Engineering Department. Although Aviation Section Training Manual Number 2 in 1917 established a three-tiered system of maintenance, with major repair and overhaul supposedly handled at general repair depots, only a handful of these depots existed, and Kelly's shops were forced by necessity to undertake these tasks. To some extent, this situation was accepted by the Air Service when, for the first time, it spelled out the duties of the engineering officer at a training field in February 1918.

Bulletin 952 from the Information Section of the Air Division, issued on February 11, 1918, specified that the engineering officer at a flying school was responsible for routine maintenance of hangars and aircraft, the care of the airfield itself, maintenance of all post buildings and facilities, supervision of all motor vehicles (including fire trucks), and the activities of all the repair shops. These shops ran the spectrum of repair activities, including engine repair and testing, welding and brazing, painting and dope application, woodworking, fabric application, and vulcanizing. To carry out this wide variety of responsibilities, which made him, in effect, the local transportation and facilities officer as well as the maintenance chief, the engineering officer had five subordinate officers to oversee each subdivision. By contrast, although his duties were similar, the engineering officer at a depot did not have to worry about the condition of the flying field or routine maintenance of aircraft in service.

Of the five areas of responsibility spelled out in early 1918, that encompassing the shops was the most diverse. At Kelly the shops were organized into five divisions: the Motor Repair Division, the Airplane Division, the Woodworking Department, the Field and Hangar Division, and the Testing and Inspection Stage. Kelly Field was unique in having a separate Woodworking Department; other fields incorporated this branch within the Airplane Division.

The Curtiss OX-5 engine of the "Jenny" was the main work load for Kelly's engine shops in World War I.

Woodworking was, in fact, a crucial element in aircraft maintenance. All major aircraft framing was of wood in 1918, making this department responsible for construction (or, in many cases reconstruction) of the parts that made up the basic aircraft fuselage. Under Lieutenant Bagnell and Lieutenant Paul N. Edwards, the Woodworking Department pioneered the use of jigs to simplify the production of ribs, spars, and other necessary parts in quantity--in many cases eliminating the need to purchase such parts from aircraft manufacturers. The Woodworking Department also had to maintain and produce propellers--a highly demanding craft, especially in the high heat of a south Texas summer. The 1st Aero Squadron had trouble with propellers literally disintegrating during 1916 as a result of the glue holding the laminations drying out. For a time the Air Service resorted to storing propellers in large humidors between flights. By 1918, however, Kelly's mechanics had developed a poplar propeller which became known as the "Kelly Field Propeller," none of which ever gave way.

The parts produced by the Woodworking Department went to the Airplane Division for assembly. Initially called the Experimental and Repair Division, the Airplane Division repaired and built fuselage and wing frames, repaired flight instruments, put the fabric on wings and fuselages, completed final assembly of aircraft, and supervised the collection of damaged aircraft by the "Wrecking Crew." The construction of a new aircraft took about 230 hours by the summer of 1918, and the Airplane Division could (and did) assemble entire JN-4 aircraft using only parts salvaged or constructed at the field.

Early aircraft mechanics had to be skilled woodworkers.

Aircraft Maintenance in 1917

An aircraft of 1917 was a curious combination of both new and old technology. Much of their structure was wooden. Men skilled in carpentry thus formed a crucial part of the maintenance team.

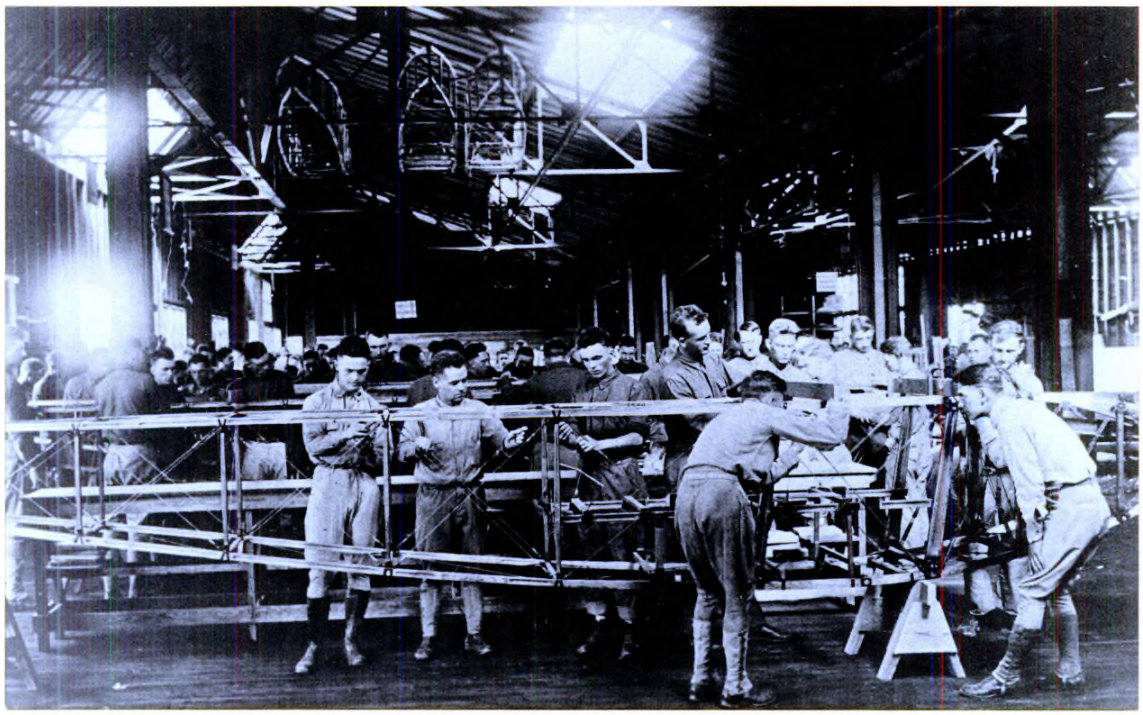

Wing installation and repair is one illustration of this. Wing ribs were cut from spruce to match a pattern. Variations between the new rib and the pattern had to be corrected by hand. The various pieces of the wing were assembled with glue, grommets, and small nails, after which the ribs could be fitted between the larger pieces which formed the trailing and leading wing edges. The whole assembly was held together with wire braces, adjusted with turnbuckles. Tension on the wires had to be almost perfect. Too much, and the stress would snap the wing; too little, and the wing would not support the aircraft in flight. Adjusting the wires so the wing was straight was known as "tuning."

Wing surfaces were cloth. Mercanized cotton was sewn into a tube or sock, then turned inside out so the seams were inside. This tube was pulled over the frame of a wing and the final seam sewed along the edge nearest the fuselage. The cotton fabric was sprayed with water and allowed to dry, shrinking tight against the wooden frame. Once dry, the wing was painted with six coats of clear acetone dope to make it hard, and a seventh coat with pigment for color. Ailerons were built separately in a process identical to the wing, and then attached. In the photos, mechanics are assembling frames which belong to a Curtiss R-4 (an early trainer).

Aligning a Fuselage

Fuselage construction was basically the same. Alignment of the fuselage frame was critical, though, if only to avoid having an aircraft that was difficult to control in the air. Alignment was attained and kept with wire braces, again held with turnbuckles. Difficult to do accurately by eye, fuselage alignment was eased by the development of a jig. The fuselage was suspended above the jig, and plumb bobs hung from key points to markers on the jig. One mechanic would crawl inside the fuselage and adjust the turnbuckles until colleagues outside indicated that the plumb bobs matched the jig markers.

The San Antonio Supply Depot

Paralleling the development of institutionalized Air Service maintenance was the growth of aviation supply. In 1914, the Signal Corps established a small supply depot at Fort Sam Houston under the command of Captain J. C. Minus. By 1917, this depot, now commanded by Lieutenant J. C. Tips, occupied a warehouse at 1903 South Flores Street in San Antonio, with its administrative office on the second floor of the Tips Hardware Store on Commerce Street. Tips supervised a pair of officers, a handful of enlisted men, and between eight and ten civilian employees who handled some $4000 worth of Army materiel.

The rapid expansion of Kelly Field during 1917 placed great strains on the depot, in part because of the five to seven miles between it and the field. As a temporary expedient, the depot used a hangar on the field as a warehouse. At the same time, the proliferation of flying fields around the country led the Air Service to decentralize supply operations through the creation of a number of large general supply depots at locations from which they could serve a number of different fields. Since planners expected to build a number of fields in the San Antonio area, Kelly Field became a natural choice for one of these depots. In October 1917, construction began on a large wooden warehouse, designed in a U-shape to allow railcars to be unloaded directly into storage.

The new warehouse was not ready for use until June 1918. In the meantime, the enormous growth in the depot's work load led the Air Service to assign the 337th Aero Squadron (renumbered as the 675th) to the depot in January 1918 and the 326th Aero Squadron (renumbered as the 662nd) in May. The unknown author of the 675th squadron's section of the 1919 Kelly Field yearbook recalled that the selection process for enlisted men differed from that used for all the other squadrons formed to that time. Each man taken into the 675th was personally interviewed by Lieutenant John Dewey and Lieutenant William P. Bates, the squadron commander and his executive officer. For a time the squadron bunked in the temporary warehouse used by the depot, but the men soon found themselves forced to move into tents pitched nearby until barracks were ready. Admitting

"Miss Kelly Field"

In December 1917, the small Signal Corps aviation supply depot became the nucleus of a much larger organization, the Aviation General Supply Depot. The first warehouses at Kelly had not been completed when civilian workers were asked to volunteer to work "in the wilderness." Stella Davis, a stenographer and typist for the supply depot, was the only woman to volunteer.

Conditions were primitive at first. There were no bus routes to the field in 1917-1918, so the Army sent a special car to take her to work and bring her home again. During cold weather, Mrs. Davis wrapped a blanket around herself for warmth during the bumpy ride. To keep warm, she carried a small coal oil stove with her wherever she worked.

Stella Davis retired in September 1945. When asked why she volunteered to work "in the wilderness" in 1917 without the usual office amenities, Kelly's first woman employee stated that her country was at war and needed her help--sentiments echoed by thousands of other women who have followed in her footsteps to serve their country at Kelly.

Kelly Number 1 at the end of World War I. The large depot warehouse is in the right center. The spur from the Missouri-Pacific tracks is clearly visible. The buildings running diagonally from the warehouse toward the middle foreground are mess halls and office buildings of the 1st Training Brigade, whose tents covered the empty ground during the war.

that the squadron "had it very easy for a spell," the surge of material arriving for either storage or redistribution forced the employment of even the administrative staff as physical laborers.

The 662nd Aero Squadron arrived by a more circuitous route. Formed in December 1917, the squadron spent several weeks in the 2nd Training Brigade before moving to Kelly Number 2 (and spending three damp nights housed in tent hangars). There they worked on aircraft and motors as part of the Engineering Department. Scheduled to embark with three other squadrons for France in May, the 662nd was abruptly ordered to report to the supply depot. Upon arrival, recorded the anonymous author of their section of the 1919 yearbook, they simply "pitched our tents on any vacant spot we could find next to the warehouse" and went to work.

By the end of World War I, the 300 enlisted men and fifty civilians of the San Antonio Aviation General Supply Depot were unloading or loading between 200 and 300 railcars each month. By this time Lieutenant Tips was gone, replaced by Captain Samuel Anable in April 1918. Anable was, in turn, succeeded by Lieutenant Colonel William F. Pearson, who took over in August 1918 and was still commanding the depot when the war ended.

Post-War Consolidation

Although the end of World War I brought rapid demobilization and the discharge of the enlisted men of the depot, it did not bring a complete halt to depot operations. Pearson left for duty with the Division of Military Aeronautics in December and was succeeded by Major George H. Brett. Brett was in place for only two months before Major William H. Garrison arrived to succeed him in February 1919. The following month the last enlisted personnel left and the depot went on civilian status.

One of Garrison's major concerns was the lack of quarters for the eight or nine other officers at the depot, but it was not until early 1920 that he obtained permission to use local labor and salvaged material to construct officers' quarters. By 1922, nine bungalow-style buildings were up along present-day Robins Drive to the immediate east of the main depot

building, forming the core of what would become Kelly's "Bungalow Colony." Built mainly of salvaged pine lumber, the quarters were viewed as among the finest in the area. Inspiring much envy, the houses had the advantage of being heated from a central steam plant, eliminating for the residents the tiresome and dirty chore of stoking a coal-fired furnace. Nearly fifty years later, Garrison's "Bungalow Colony" would still be the quarters of the senior officers of Kelly, forming a small oasis of picturesque charm amid the machinery and bustle of a modern logistics center.

During Garrison's tenure as depot commander, the Air Service also followed through on a program of consolidating the supply and repair depots which had proliferated nationwide during the war. As part of this policy, in March 1921, the Aviation Repair Depot at Love Field, Texas, was moved to Kelly and joined to the existing supply depot to form the San Antonio Air Intermediate Depot. The relocation of the Air Service Mechanics School to Chanute Field meant that ample repair facilities existed for the new depot (one of only three in the country) which held responsibility for maintenance and repair of all Army aircraft in the large Eighth Corps Area encompassing most of the United States between the Mississippi and the West Coast. During the next few years, the personnel of the depot would demonstrate their skills by preparing Lieutenant Jimmy Doolittle's DH-4 for his coast-to-coast dash in 1922, tuning up the aircraft of the Pan American Goodwill Flight, and ensuring the regular repair of the hard-used trainers of the Advanced Flying School at the north end of the field.

The Creation of Duncan Field

At the beginning of 1925, Kelly Field was home to both the Advanced Flying School and the San Antonio Air Intermediate Depot, divergent functions which complicated local administration. Although it would be another year before the combination of the reports of the Lassiter and Morrow Boards, lobbying by Air Service leaders, and Congressional investigation would result in the passage of the Air Corps Act of 1926; the Air Service was already concerned with the need to develop an organization which would separate flying and support activities. Thus, in March 1925, Kelly Number 1, the site of the depot, was renamed Duncan Field, formally separating the activities of the depot from those of the flyers on Kelly Number 2--which retained the designation Kelly Field. Creation of the Air Corps Materiel Division a year later (as part of the reorganization called for by the Air Corps Act) merely confirmed the emergent command structure of the Army's air arm.

Major William Garrison, first commander of the San Antonio Air Intermediate Depot and later founder of the USAA Insurance Company.

The houses in the Duncan Field "Bungalow Colony" are still used as homes for Kelly's senior military officers. The white building in the center of the photograph was the headquarters of the Air Corps Training Center. Today it is the headquarters of Kelly's Security Police Squadron.

Off to a Muddy Start

The cold rain that fell on Kelly Field this particular February afternoon in 1921 turned the normally parched South Texas soil into a quagmire of mud. A small group of men waded through the muck unloading railroad cars that had traveled 300 miles south from the Aviation Repair Depot at Love Field in Dallas.

The men from Love Field viewed their new "home" with some dismay. The scene revealed rough cut wooden buildings, mud, a huge U-shaped warehouse, tin corrugated iron hangars, and more mud. Captain Edward Laughlin, repair depot commander, chose a tiny office attached to one of the hangars to hold his first meeting. It was the only one with a concrete floor. After the rains abated, one of the first jobs the new arrivals tackled was covering the dirt floors in the rest of their buildings with a thick layer of concrete.

The move from Love Field was completed in March. Out of habit, the last man to leave the old Dallas depot locked the door. Since he had no further use for the key, he threw it away. It's doubtful that the men who slogged through the mud in 1921 realized they were laying the ground work for the logistical giant that exists today. However, the spirit and dedication demonstrated seven decades ago remains as part of the Kelly tradition.

Depot Activities in the 1920s and 1930s

In 1927, the depot's designation changed, and it became, simply, the San Antonio Air Depot. For a few years, too, Duncan Field was the home of the Headquarters of the Air Corps Training Center, which moved to brand-new Randolph Field in 1930. Aside from such minor shifts, the activities of the depot remained very much the same for the next fourteen years.

In 1926, depot commander Major Frank Lackland offered a summary of its activities and responsibilities in the "Army and Navy Courier." Including the commander, there were only ten officers assigned to the depot from the Air Corps, a single officer of the Quartermaster Corps, and three warrant officers. All other depot personnel were civilians--453 of them in 1926 and still less than a 1,000 by 1938. Their skills ran the gamut. There were blacksmiths, cabinetmakers, carpenters, electricians, chauffeurs, machinists, plumbers, mechanics, molders, crane operators, painters, riggers, fabric workers, and general repairmen, as well as messengers, stenographers, and repairmen. They handled every class of

Military members of the Aviation Repair Depot which moved to Kelly from Dallas in 1921. Captain Edward Laughlin, Chief Engineering Officer, is third from left.

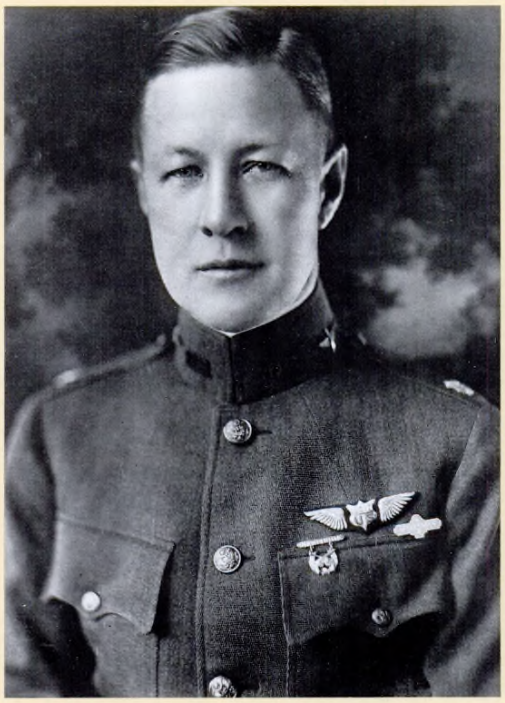

Air Corps equipment from cotter pins to complete aircraft, storing literally hundreds of wings, propellers, and engine parts in their warehouses and repair shops. According to Major Lackland, at least a third of the Army's aircraft were located within the Eighth Corps Area, and up to fifty percent of Army flying took place in the same area--6,000 hours a month just at the nearby flying schools. In 1925, the depot overhauled and repaired 452 aircraft and 865 engines. A decade later, the depot managed to overhaul 287 aircraft and 650 engines, while doing minor repair or service to a further 329 aircraft and 320 engines.

The two main components of the depot were the Depot Supply Department and the Engineering Department. There was also a Station Supply Department which monitored the supplies within the Engineering Department; a Station Accounting Department; an Inspection Department; and a Flying Department. As its name suggests, the Flying Department supervised the test flights of repaired and rebuilt aircraft, piloted by all the rated personnel assigned to the depot in addition to their other duties. In 1925, this involved a total of over 8,400 flights and 21,000 flying hours.

By and large, the organization of the depot remained unchanged into the late 1930s. The only major addition was the activation of the 3rd Transportation Squadron in 1936, to ferry freight and personnel within the Air Corps Materiel Division. The squadron formed a part of the 10th Transport Group, headquartered at Wright Field, Ohio, and its aircraft were held by them via a memorandum receipt from the depot. Initially, the squadron consisted of a single officer and fifty-four enlisted men. Three more officers joined by 1938, and in 1939 ten reserve officers went on extended active duty with the squadron.

Duncan Field Facilities

For much of the 1920s, the depot utilized the hangars and warehouses constructed during World War I. Demobilization left a large number of wooden barracks, along with associated mess halls, offices, and other structures, that were steadily torn down through the early years of the decade. Some of the material from these ended up in the "Bungalow

Major Thomas Duncan

Major Thomas Duncan graduated from the United States Military Academy at West Point and received his commission as a second lieutenant in the Coast Artillery in 1905. After service at various installations around the United States and the Philippines, he transferred to the Signal Corps in 1917 for service in the Aviation Section. He arrived at Kelly Field on November 23, 1917, and served as Kelly's Executive Officer, Summary Court Officer, Survey Officer, and Inspector, while learning to fly in his "spare" time.

In June 1918, Major Duncan assumed command of Wilbur Wright Field in Fairfield, Ohio. After World War I, he worked in the office of the Chief of the Air Service in Washington, D.C., and at the Militia Bureau, the equivalent of today's National Guard. On May 23, 1923, while on a practice flight at Bolling Field in Washington, Major Duncan's aircraft crashed at the south end of the field, killing him and his passenger, a War Department civilian. Subsequently, Major Duncan was described as the most popular and admired officer in the Air Service.

On March 13, 1925, the name of Kelly Number 1 was changed to Duncan Field. Remarking upon the name change, Major Frank Lackland, a good friend of Duncan's and Commander of the San Antonio Air Intermediate Depot (and Duncan Field) at the time, said, "Probably no one officer in the Air Service was so well known to and beloved by officers and enlisted men."

Colony" of officers' quarters built between 1921 and 1927, but much of it was simply discarded.

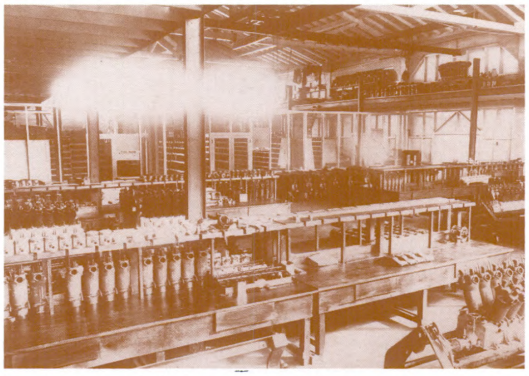

For most maintenance activities in the first decade following World War I, the depot made use of the original tin-roofed, iron-framed hangars erected by Koerner in 1917. Of the original twelve, only five remained in existence by 1937, with one serving as a combination warehouse and post exchange and two others remodeled into a barracks and mess hall for the men of the transport squadron. By 1938, they, too, were replaced by purpose built structures, and the remaining hangars served primarily as storage areas for maintenance supplies and equipment.

Immediately south of the 1917 Koerner hangars was an engine test building. Although open-air test stands existed in this area during World War I, these were replaced with a new test building in 1936, supplemented by test stands erected between the Koerner hangars. During 1939 the depot commander, Lieutenant Colonel Henry J. F. Miller, gave top priority to the construction of a larger set of four engine test cells in the same area. Although Air Corps expansion during the last years of the decade gave added urgency to his requests for additional engine test space, construction of these new engine test cells was not underway until 1941. They filled a long, narrow rectangle parallel to the railroad tracks south of the original line of Koerner hangars and just to the west of the 1936 engine test building and were turned over to the depot in October.

In 1933, engineering and maintenance operations largely relocated to a large, concrete-and-steel hangar built by the A. J. Rife Construction Company of Dallas. Measuring 448 feet by 560 feet, this hangar (still a dominant structure in Kelly's maintenance area), dramatically increased the shop space available to the depot.

Among other important structures during the 1930s were a pair of hangars to the north of the engineering shops. Built in 1932, these two hangars were the home of the test division. Their checkerboard roofs show up clearly on aerial photographs from the 1930s, and both are still in use. Long known as Test Flight Hangars Number 1 and Number 2, they are still marked with those numbers, convincing many people that they are the first two hangars at the field.

Another pair of hangars stood across the field to the southwest for the use of the transport squadron.

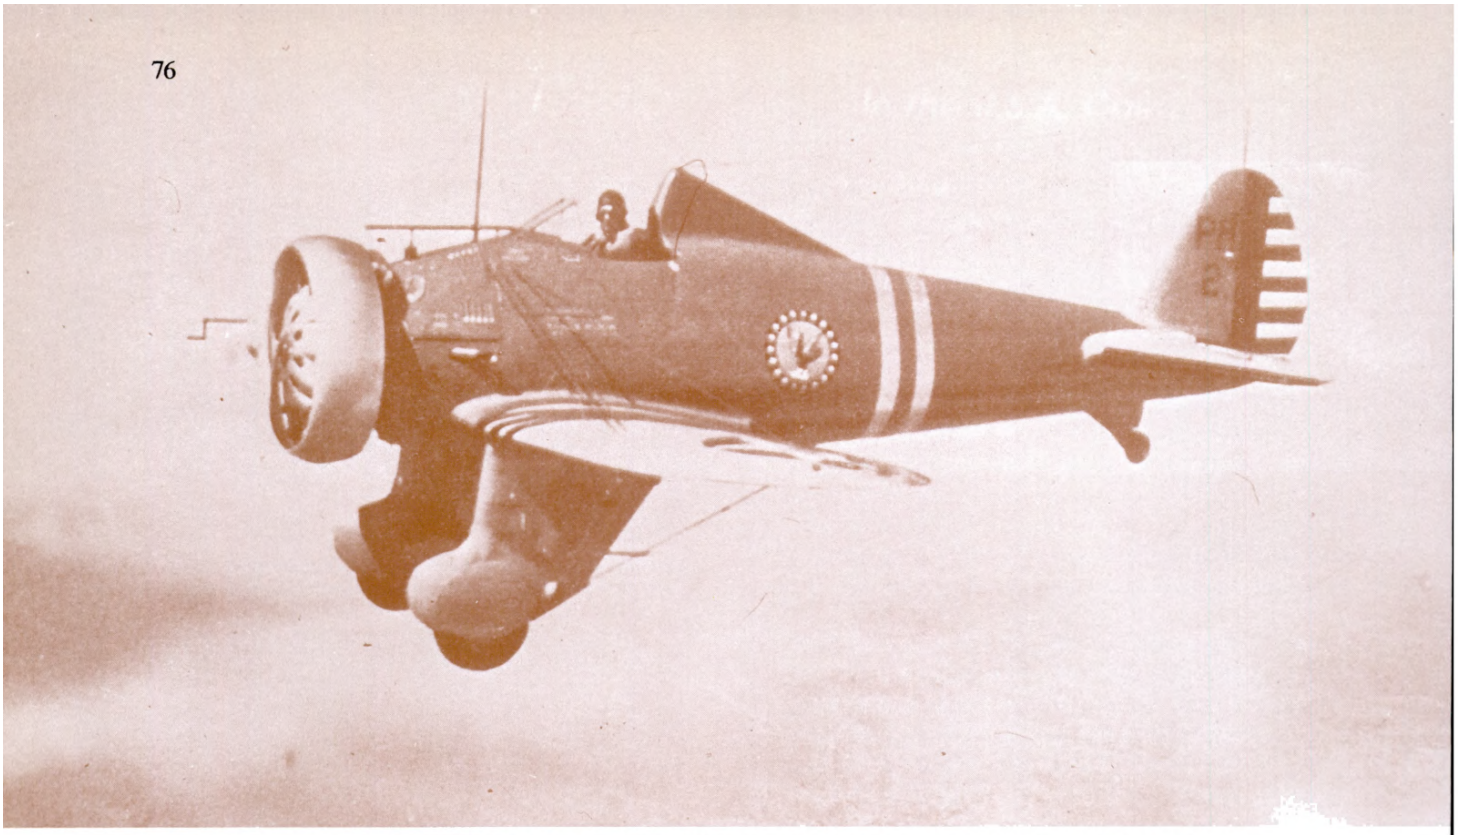

Warehouses of the Depot Supply Department were filled with ordered bins of literally hundreds of parts.

A smaller, hangar-like structure nearby housed field operations, while between the two hangars a small, two-story, wooden building served transient aircraft crews.

To the east of the test flight hangars sat the warehouses of the supply division. The largest of these was the 1918 depot supply warehouse, measuring 830 feet by 270 feet, and built so that the rail line ran directly into a U-shaped central area. Large as it was, this warehouse was insufficient by the 1930s and had been supplemented by six smaller structures built on either side of the railroad tracks to the south. All were built of wood and viewed as temporary, but nothing better was available as Air Corps expansion got underway at the end of the decade. Inspectors reported that "millions of dollars of government property is constantly exposed to fire hazard and deterioration because of inadequate storage facilities;" but Colonel Miller still had to struggle to gain authority to build another warehouse. The initial plan of the new building, featuring a U-shaped opening to accommodate a rail line, echoed that of the 1918 structure. In late 1939, however, this plan

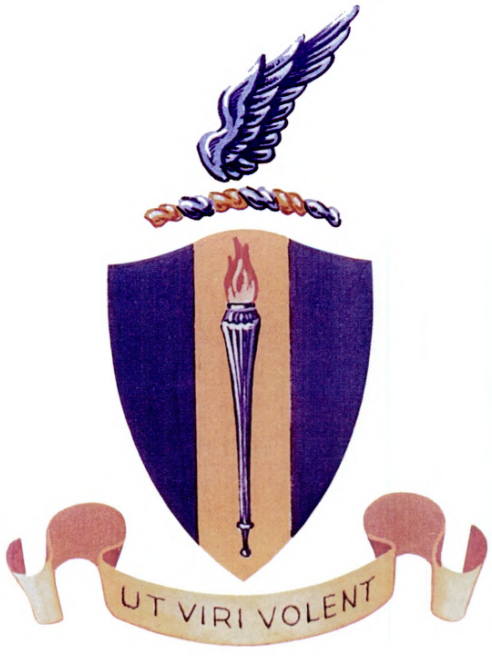

The appearance of the Boeing P-26 in 1933 marked the beginning of the end for fabric-covered, biplanes.

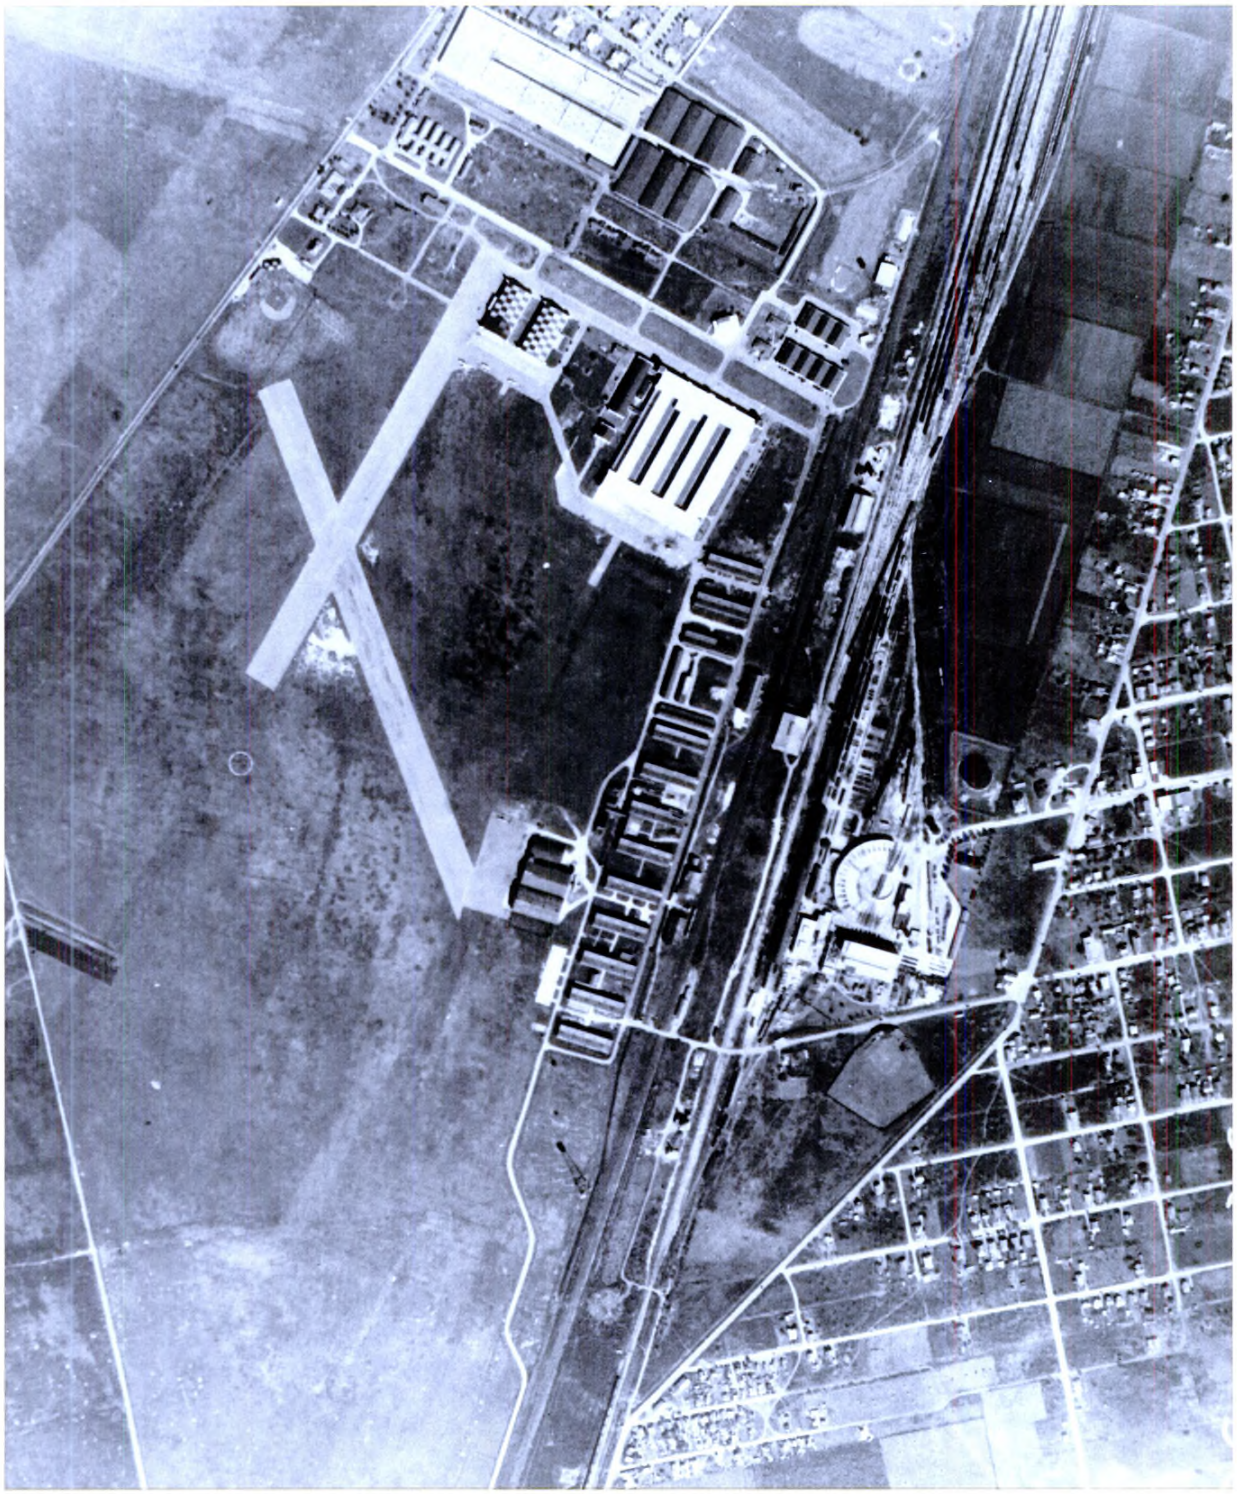

was dropped in favor of one for a smaller, single-story structure without an internal railroad bay. By the time this new warehouse was accepted in September 1941, it was already inadequate, and plans existed for an addition. In any event, the addition was not completed until the spring of 1942, by which time storage space at Duncan Field was desperately short.

Last Years of Peace

Until expansion began to fundamentally change depot operations at the very end of the 1930s, the pace of life had been predictable and the work force small and self-contained. Turnover was small; good jobs were hard to find in the Depression. Weekend hunting and fishing trips brought civilians and officers together, and most of the civilian employees knew each other and their families. Even as the pressure of Air Corps growth began to transform Duncan Field in 1940 and 1941, few, if any, of the men and women of the depot would predict that within a few, short years a twenty-fold expansion would completely alter both the depot and its relationship with the flying field to the north. Everything was about to change.

Distinctive insignia of the Advanced Flying School with its motto "That Men May Fly."

Duncan Field in 1935. The checkerboard roofs of the transient aircraft hangars are clearly visible to the north of the large repair hangar. At this point, Koerner's steel-and-concrete hangars along the railroad tracks were still in use.

Chapter Four

Global War:

Reorganization and Restructuring During World War II

By the end of the 1930s, it was clear to American leaders that the aggressive expansionism of Nazi Germany and Imperial Japan would soon bring on a war which inevitably would threaten American security. By the outbreak of war in Europe in 1939, the United States was slowly but surely moving away from the isolationism that dominated the 1920s and 1930s and preparing to face challenges which dwarfed those faced a generation before. The progress of American preparedness was not entirely smooth. There was widespread debate both within and without the government about the proper policies to follow. But amid the rhetoric and debate, two facts were crystal clear: whatever military policies the United States adopted, airpower would be a fundamental part of effective military strength, and the effective development of American airpower would demand unparalled expansion.

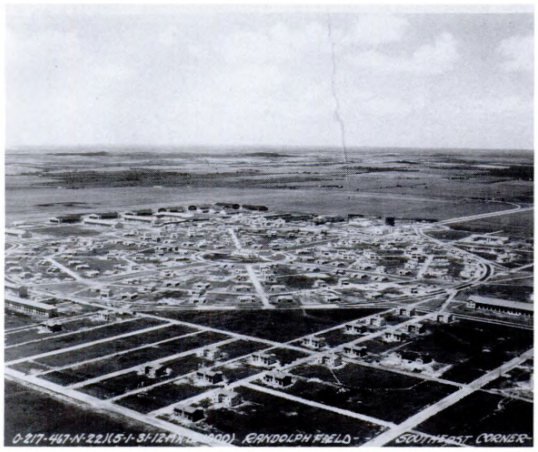

Pilot Training Programs

Air Corps expansion began with President Franklin Delano Roosevelt's message to Congress in January 1939 asking for $300 million for "defensive aviation." Over the next two years, as aircraft manufacturers began to produce designs and tool-up factories for production, planners consistently increased estimated personnel needs. Initial plans called for the creation of twenty-four flying groups by June 1941, but in May 1940 planners revised the program upward to a total of forty-one groups Only two months later the total was again revised, to fifty-four groups, and by the fall of 1941 the Air Corps--now the Army Air Forces--planned to have a total of eighty-four groups by the end of June 1942. By December 7, 1941, seventy of these groups existed, although most were still only cadres and few possessed appropriate aircraft.

The struggle to produce increased numbers of modern aircraft was undoubtedly the story most closely followed by the public. But of even more importance was the effort to provide trained pilots, aircrew, and mechanics for the growing force. Between July 1939 and July 1941, Air Corps strength leaped from around 20,500 officers and men to over 152,000--a total which was still increasing rapidly at the time of Pearl Harbor. The initial goals set in 1939 demanded the training of 1,200 pilots per year, a level which jumped to 7,000 per year within a few months and grew dramatically with each new expansion program. By the fall of 1941, as planners debated the eighty-four group program, the Army Air Forces predicted a need for upwards of 50,000 pilots per year by mid-1942.

General Henry H. "Hap" Arnold oversaw the expansion of the Air Corps into the Army Air Forces of World War II.

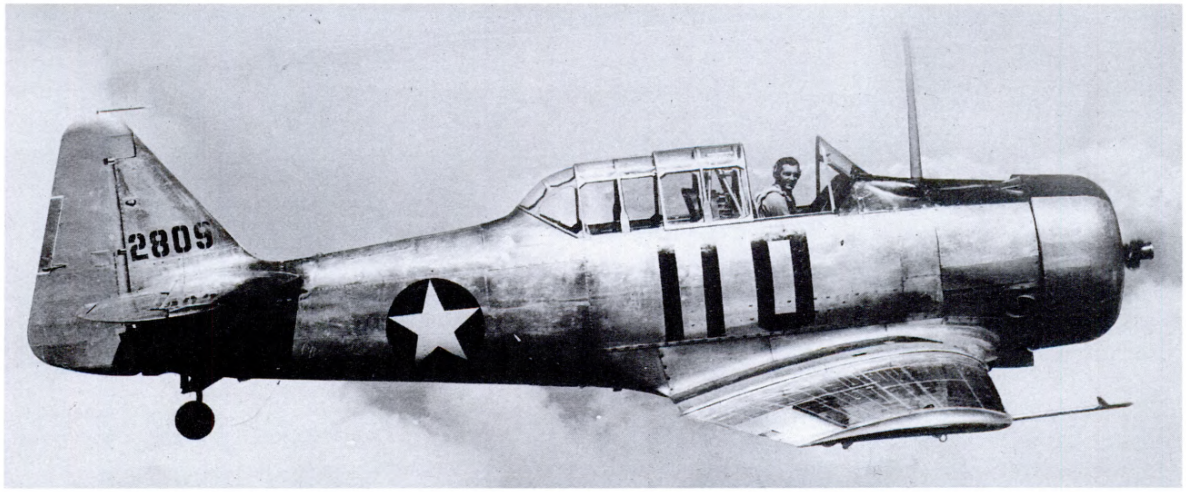

Headquarters of the Gulf Coast Training Center was at Randolph Field--later the home of the Air Training Command.

Even the earliest of the pilot training goals was beyond the capacity of the existing training fields. Thus, during the years from 1939 to 1941, the Air Corps began using civilian training schools for primary flight training. The first nine of these civilian primary schools began operating in May 1939, with more added steadily during the next two years. By December 1941, the total number was forty-one, and it peaked at fifty-three in 1943. By that time all primary flight training was being handled under contract to these schools. At first, Randolph Field was viewed as capable of handling the basic training of the cadets coming from the civilian primary schools, with Kelly and Brooks Fields carrying out advanced training. But when the fall of France in the spring of 1940 brought forth the 7,000 pilot program, the situation changed. The Air Corps Training and Operations Division in Washington, D. C. promptly reorganized the training structure, creating two new training centers. A center at Maxwell Field, Alabama, (the Southeast Training Center) took responsibility for all training east of the 92nd meridian, and a center at Moffett Field, California (the West Coast Training Center), took control over training west of the 108th meridian. The former Air Corps Training Center at Randolph Field became the Gulf Coast Training Center, with responsibility for the rest of the country. Each training center was to supervise the creation of a series of new basic and advanced training fields, gunnery stations, and other specialized training centers. As a result, Kelly Field lost its former status as the nation's single advanced flying school, even though it remained a key center of flying training.

Changes in Flying Training

Prior to 1939, cadets received advanced training in one of four specialties--pursuit, bombardment, attack, or observation. This specialization ended in June 1939, and for a time all cadets theoretically received the same course of instruction. Course time was shortened, too. Beginning with Class 40-A, which entered training in December 1939, the advanced course was cut from four to three months to allow more classes per year. The advent of the 7,000 pilot program forced a further cut in the length of the

The AT-6 "Texan" (called the "Harvard" by the British) was the dominant advanced trainer of World War II.

advanced course to ten weeks, a time period retained when the 12,000 pilot program emerged. By September 1940, basic and primary training were limited to nine weeks each, and advanced schools were designated as either single or twin-engine schools. Under this program Kelly became a twin-engine advanced school. Air Corps plans to double the rate of aircrew training in 1941 to meet the demands of the eighty-four group program forced a further limitation on the time spent in advanced training. All phases of flying training became nine weeks long with training conducted seven days a week. By 1941, training was concentrated into just over six months.

War Comes to Kelly

Pearl Harbor, and the entry of the United States into World War II, brought plans for the annual production of 70,000 pilots, but it did not substantially alter the curriculum by then in place. The pace of training increased dramatically, but the pattern of instruction remained fairly consistent throughout the war. The instructor explained, then demonstrated, each maneuver. After this, the student-pilot attempted the manuever, and the instructor offered verbal correction and explanation of any errors. As far as possible, a student retained the same instructor throughout a phase of training, allowing development of a rapport between teacher and student that facilitated instruction. In most ways, this process followed the "all through" or Gosport system, pioneered during World War I. Although the Army Air Forces experimented with a different approach in 1943, with students progressing through stages at their own pace with different instructors at each stage, scheduling difficulties and the demand placed on instructors persuaded trainers to return to the standard system. The bond between student and teacher may have been an intangible aspect of training, but it was clearly vital.

Before the arrival of these AT-9 trainers, pilots destined for multi-engine duty were forced to train in single-engine aircraft.

Kelly Aircraft, 1938-1943

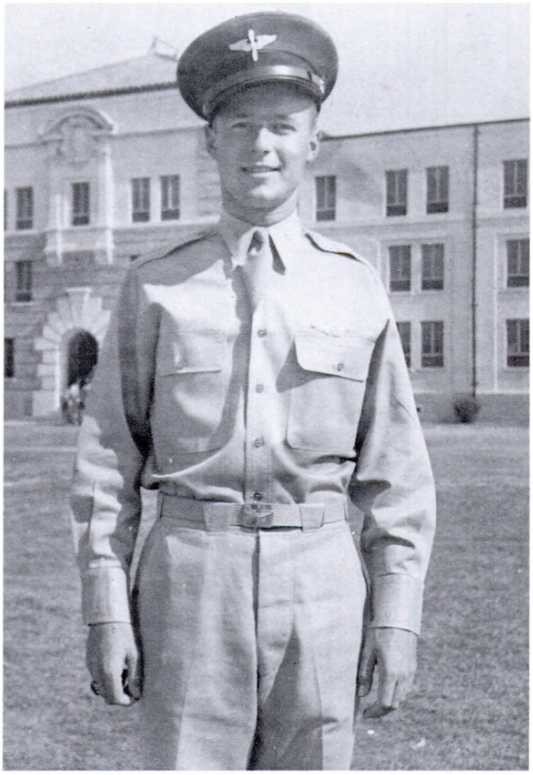

Training aircraft were at a premium during the first years of the war. In too many cases, schools relied on antiquated or inadequate equipment, a situation which was not entirely new. A 1937 Inspector General's report bluntly stated that Kelly Field's aircraft were "largely made up of the oldest and most out of date airplanes in the Air Corps," and urged that no further bombardment training take place at the field.

Colonel Arnold N. Krogstad, the Commandant of the Advanced Flying School, protested that graduates from the school were joining tactical units three times a year, with no complaints about their skill or ability to fly bombers--or any other type of aircraft. Krogstad admitted that some of Kelly's aircraft were "obsolete," but argued that the situation was improving as new, more modern types arrived. However, as Air Corps expansion got underway in 1938, Kelly's aircraft inventory still included large numbers of obsolete and obsolescent planes. Among these were thirteen P-12 and nineteen BT-8 trainers for pursuit pilots, fourteen O-25 and two O-38 observation aircraft, and twenty-four A-17 attack planes. Bombardment students were forced to train in a handful of B-7, B-4, and B-18 aircraft, with only the B-18s resembling the more modern bombers in development. With only three B-18s assigned, the advanced school was forced to have some students fly only as copilots on many training flights. As a temporary expedient, the field borrowed a B-18 from Randolph Field and obtained four C-40 aircraft. These were hardly bombardment aircraft, but they at least gave some students an opportunity to fly a more modern, multi-engine plane.

In late 1939, BC-1 trainers began to arrive at the field, with small numbers of AT-6 "Texans" supplementing them in the spring of 1940. By May, the school had some fifty-two AT-6s and needed seventy-three more. The opening of additional training schools was a persistent drain on Kelly's aircraft inventory since the field had to send many of its aircraft to the new schools. At least officially, Kelly was a twin-engine school, and both the BC-1 and the AT-6 were single engine aircraft. Unfortunately, nothing else was available. For nearly a year, future pilots received their advanced training on the "Texan." Not until September 1942 did Beech AT-10 and Curtiss AT-9 twin-engine trainers arrive at Kelly in suitable numbers. Neither was a truly satisfactory substitute for the frontline aircraft in use (no really good twin-engine trainer appeared until modified B-25s were available in 1944), and the first class which could make use of them, Class 42-K, was, ironically, the last flying training class at Kelly.

Student Flow

Shortening the length of the advanced course was one way to increase the production of pilots; another was the simultaneous instruction of classes. By June 1939, new classes entered every six weeks, with two classes in training at the same time. By May 1940, a new class arrived every five weeks, allowing nine

John Phillips graduated with Class 42-I in October 1942. By this time cadet blue was replaced by Army olive, and cadets were titled "Aviation Cadets" rather than "Flying Cadets.

classes to graduate per year. Reducing the course to nine weeks allowed eleven classes to complete training during 1942, a pace that put enormous strain on overworked instructors and forced maximum use of whatever training aircraft were available. Nevertheless, from Class 38-A (which actually entered advanced training in October 1937) through Class 42-K, 7,123 candidates began advanced training at Kelly, with 6,845 graduating. These numbers become even more impressive when added to those of previous years. By the time flying training ended at Kelly in 1943, 9,616 Army pilots had won their wings at the field since 1922. Even as it became only one of many sources for the pilots of the American air armadas of World War II, Kelly remained a vital part of the training scheme.

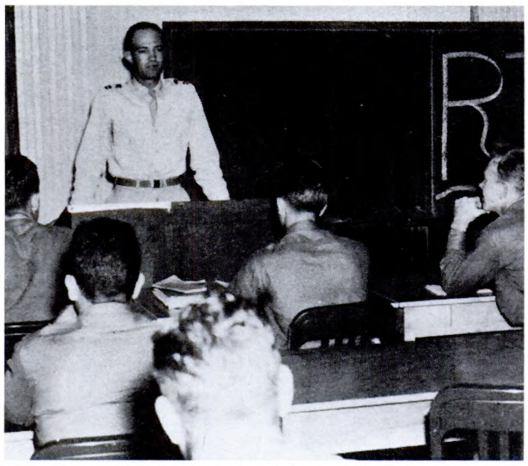

The experiences of the men who passed through the field during the last few years of training largely echoed those of earlier years. The pace of training may have been faster; but in their eagerness and enthusiasm, most did not really notice. Philip Ardery came to Kelly's advanced school in early 1941 after primary training in Nebraska and basic flight training at Randolph Field. Freed from much of the ground routine of earlier schools, Ardery found that the emphasis at Kelly was on flying, not drill and ceremony. Like those of many earlier aviation cadets, his written recollections focused on the night flights made by all students. As always, they were exciting. Even though cadets now had the benefit of radio-beam navigation aids, many cadets still managed to get lost. On a night flight to Corpus Christi, recalled Ardery, one young flyer overshot and flew for some distance over the Gulf of Mexico. Fortunately, he managed to get turned around in time to land at the Corpus airfield just before running out of fuel. Warren Polking, who graduated with Class 40-F, recalled the night flights, too. A shortage of barrack space in 1940 forced many cadets into tents, and Polking remembered that one trick of those cadets returning from a night flight was to glide in over the tent lines, with the propellor of the BC-1 (Basic Combat -1, a trainer similar to the later AT-6) at low pitch. At the last minute, a nudge of the throttle brought a colossal racket from the engine, awakening everyone and giving the incoming cadet a good chuckle to accompany his relief at having completed a successful trip.

"5:30 sure comes early in the morning," wrote an anonymous Class 41-I cadet in The Gig Sheet class book. "I don't have to think of what to do, I just get

"...Early to rise." Reveille always seemed to come too soon.

up and start moving and subconsciously I have a broom in my hand." Confronted with the cancellation of a night flight, he lamented: "I have to wait until tomorrow night and go without sleep forever." Some of his troubles might, he admitted, be due to the late nights he was keeping. Although by now aviation cadets no longer excited the interest they once had (Ardery recalled that they were referred to as Gadgets locally, and thought of as something of a nuisance when they gathered in the basement bar of the Gunter Hotel, the site of the Cadet Club during 1940-41), the young flyers still led active social lives. Officially, cadets could not be married, and the lack of parking precluded keeping a car at the field. A local girlfriend who would keep a cadet's car for him, and meet him after flying, was thus important if a cadet expected to make the trips that were a prominent feature of their weekends. The class book for Class 41-G went so far as to describe the nearby town of Bandera as "the cadet's country home." Numerous cadets made regular treks to the town on weekends for horseback riding, eating, and other activities. "Everything but sleep," asserted the writer, "but who goes up to sleep?" In a listing of activities, the classbook recorded a vast array of things that kept already busy cadets on a constant whirl: "Girls ...Tea Dances ...Athletics ...Star Parties ...Bandera ...Girls ...Tennis ...Uniforms ... Convertibles ...Cadet Club ...Riding ...Golf ...Field Days ...Spaghetti Suppers ...Girls ...Gunter Hotel ...Deep Sea Fishing ...Dove

Flying training involved long hours of classroom work as well as time in the air.

Hunting ... Girls ...Beer Parties ...Hangar Flying ...Sweeping Broadway ...Formation Driving ... Girls ...Late Dates ...Ballet ...Symphonies." If cadets worked hard, they played hard, too.

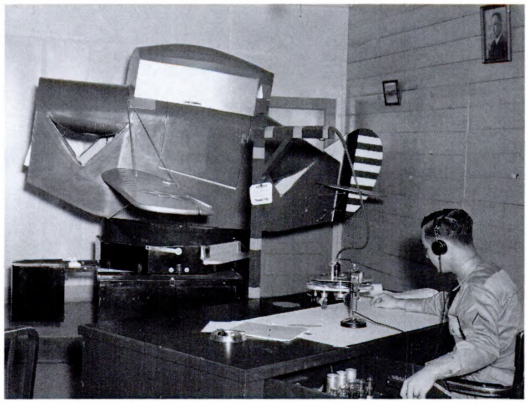

"Hangar Flying," as they called it, referred to instrument practice on the relatively new Link Trainer. The forerunner of modern simulators, the Link Trainer was a "$20,000 flying machine that never leaves the ground." In it cadets could practice instrument flying with no danger of crashing. "A man may hypothetically be killed many times a day, in one of these," wrote a cadet in the class book for Class 41-I, "and still get home to dinner." Reality, though, meant some cadets did not return for dinner. Shortly before graduation, Cadet E. C. McCaffrey died in a crash. Since Class 42-I graduated after Pearl Harbor, his death was no doubt a sobering reminder of the perils they now faced. From the Cadet Club, and Bandera, Texas, "dude ranches," 42-I went directly to war.

Instructor Pilots

A supply of skilled instructors was vital to the success of all Air Corps and Army Air Forces pilot training plans. When the contract primary program got underway in 1939, the civilian schools had little difficulty attracting good instructors. Many had over 1,000 flying hours in their log books. But as the training program expanded, it became increasingly difficult to find, and keep, good instructors. Some held reserve commissions and were called to active duty; others were recruited by the Navy; most were subject to the draft.

The civilian primary schools relied almost exclusively (and the Army-run basic schools to a lesser degree) on civilian pilots. To keep them, the Army Air Forces tried a number of approaches. During early 1942, a large number received direct commissions after completing an instructor's course run by the training centers--if they met the physical qualifications to be a military pilot. However, this was less than half of the instructors who went through the courses, and by the end of 1942 almost all those who could qualify for a commission had one. The Army tried to entice the remainder into the Air Corps Enlisted Reserve, a ploy that failed when most refused. Army Air Forces then proposed to simply give all instructors commissions, a step which Secretary of War Henry Stinson flatly refused, although some experienced instructors were simply commissioned as captains and assigned as supervisors at the contract schools. Attempts to classify instructors as employed in essential war work sometimes succeeded, and sometimes did not. And, as mentioned, despite complaints, the Navy recruited steadily in an effort to find instructors for its own flying schools.

Finding instructor pilots for the basic and advanced schools was also difficult. One source was reserve officers called to active duty; some of whom had already been instructing as civilians. Recent graduates of advanced training were consistently pressed into service, although removal for assignment to a frontline flying unit was a steady drain. A

Beginning in 1941, cadets could practice instrument flying more safely in the new Link Trainer.

Finding enough instructors for the expanded pilot training program was a persistent problem.

third source for basic and advanced instructors was those men who qualified for a commission after completing the instructor courses. Rated as service pilots, these men were not considered for assignment to combat units, but could be reassigned to fly transports, ferry aircraft from location to location, or pilot liaison aircraft. However, the Army Air Forces found them; the struggle to find and keep instructors for all stages of flying training never ceased.

Kelly Field's Central Instructors School

In order to help standardize pilot training, planners pushed for centralized training of instructors as early as 1940, but it was not until mid-1942 that the three training centers actually created centralized instructor schools. The Gulf Coast Training Center submitted its proposal for such a school in June, and the school was activated at Kelly Field on August 10. Planners used three not-yet-activated school squadrons as the organizational structure for what was termed Flying Training Group C, and the first class began on September 1.

Although plans existed almost from the start to consolidate all three instructors' schools at Randolph Field, six different types of instruction were underway at Kelly by the beginning of 1943.

The first courses taught were the Elementary Flying Instructor's Course and the Basic Flying Instructor's Course. Five weeks later, though, instruction was underway in the Elementary Pilot Classification Course, normally the first course taken by a prospective instructor. The Elementary Classification Course lasted twenty days, during which civilian flyers (some of whom had been Civil Service Instructor pilots, and all of whom had a commercial flying license) learned the rudiments of piloting primary training aircraft and were evaluated by the supervising officers. Those who completed this course went

Trainers lined up on the Kelly ramp in 1941.

on to either the Elementary Flying Instructor's Course or the Service Pilots Course. This last served to train pilots to fly utility aircraft, although a handful were recycled back into the Basic Instructor's Course. They might still end up as an instructor pilot (most did not), but they would not be assigned to a combat unit.

Officers already rated as pilots began their process of becoming an instructor with the Basic Flying Instructor's Course. A four-week course, the basic course prepared pilots to serve as instructors at the basic and advanced schools. A few might serve at the primary schools, but this was rare. Highly regarded graduates from this course, which might include some pilots who began their training as civilians, went on to either the Advanced Single-Engine Instructor's Course or the Advanced Twin-Engine Instructor's Course. These were the last courses created at Kelly's Central Instructor's School, and, as their names suggest, they prepared future instructors to teach at the advanced schools.

Flow through these courses was rapid. By the time the Central Instructor's School did move to Randolph in February 1943, 2,160 prospective instructors had begun training and 1,691 had graduated.

Navigator Training

Although some specialized training in navigation was provided by Air Corps flying units in the late 1930s, no formal school of instruction existed. Nor did planners initially foresee the demand for navigators until expansion was well underway. The handful of officers the Air Corps did send to school for formal training in navigation went to the Pan American Airways school at Coral Gables, Florida, until a small Air Corps navigation school opened at Barksdale Field, Alabama, in 1940. In 1941, belatedly recognizing the need for navigators, the Army Air Forces ordered individual training to begin at Army fields. The official history of the Army Air Forces in World War II admits, however, that this hesitant beginning meant that "no other aircrew program was started with so few qualified instructors." Demand for navigators far exceeded the supply, and few skilled men could be found to teach at the schools.

The shortage of pilots also had an impact; someone had to fly the plane for navigation students to practice, and there was a persistent shortage of pilots.

In July 1941, the Barksdale Field Navigation School moved to Kelly bringing with it the first cadre

Kelly trained navigators until 1942.

of instructors as well as the course curriculum, schedules, and aircraft. At first it was located in buildings near the Kelly flight line, but in November it moved to new quarters on "upper Kelly," or "The Hill," to the west of Leon Creek. Here it became a part of the emergent preflight school at Kelly.

In addition to the instructors from Barksdale, the Kelly Navigation School obtained a few instructors from Pan American Airways. Most came from recent graduates of the program, a practice common at all Army Air Forces navigation schools during the first few years of the war. The course was fifteen-weeks long, with both course content and curriculum consistent with that used at Barksdale Field. In contrast to the Pan American course, which spent a great deal of time on navigation theory, the Kelly course emphasized dead-reckoning and "practical" navigation. Indeed, following critiques, the amount of theory and ground school instruction was reduced even further as time went on. Training began with twenty students in August, with new classes of twenty men arriving every three weeks. At the end of December 1941, class size increased to 114 men--a class size programmed before Pearl Harbor--rising to 120 per class in February 1942.

Mathematical skill was, of course, the primary prerequisite for a successful student. A minimum score of seventy-five on a math exam was required, a hurdle which eliminated almost eighty percent of applicants. Naturally, the Army Air Forces looked for prospective candidates from among college students with math and engineering backgrounds first of all. Prior to Pearl Harbor, however, such men were in short supply and the War Department made strenuous recruiting efforts among men attempting to get into flight training programs but who lacked the visual acuity required of pilots. Another source of candidates was men who washed-out of pilot training for flying deficiencies.

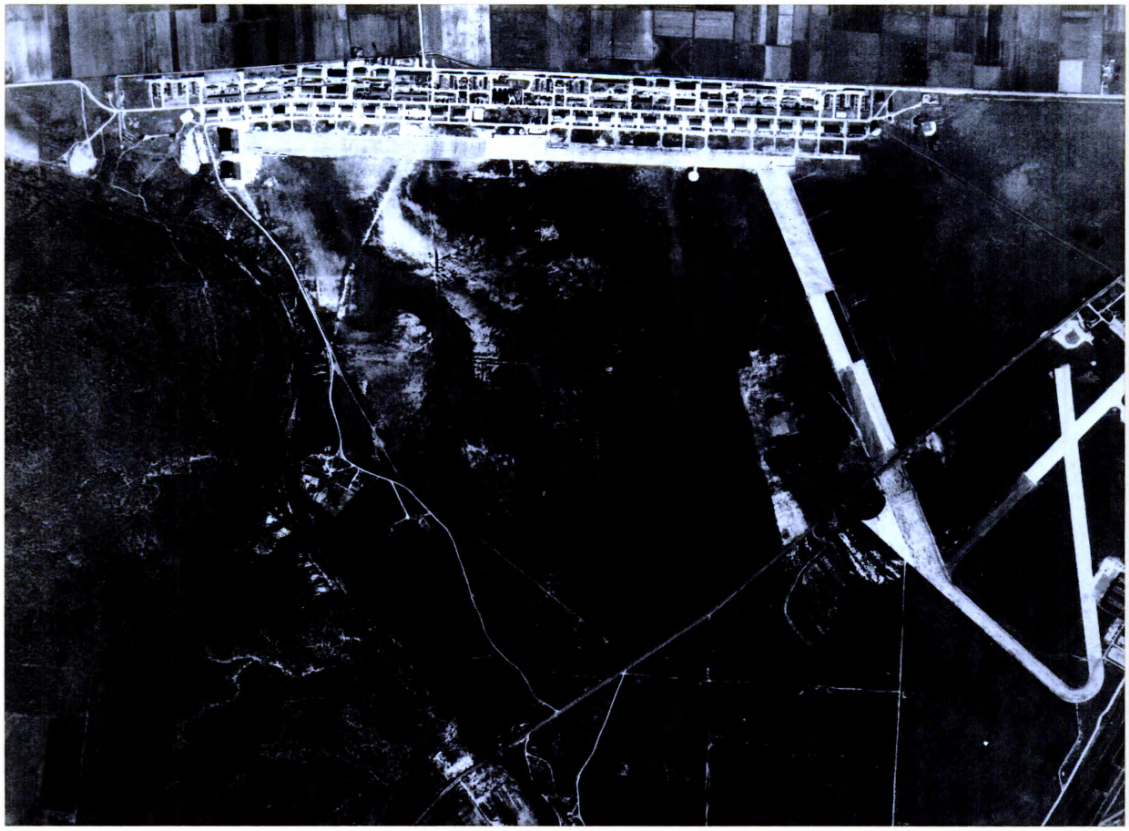

During 1942, reports from combat units suggested the possibility of changes in the course curriculum, but before any changes could be implemented, the school moved again, this time to Hondo Army Airfield. By the time it moved 818 men had entered navigator training at Kelly, with 607 men graduating.

Reception and Classification

As it had during World War I, organizing the mass of new soldier-airmen, feeding and clothing them as they made their first adjustment to military life and separating potential pilots, navigators, and bombardiers from among them, was a difficult job. Although the Air Corps began experimenting with various testing methods to identify potential aircrew members, particularly pilots, during the 1930s, the tests were

As in WW I, a tent city sprang up to accommodate arriving recruits in the early days of WWII.

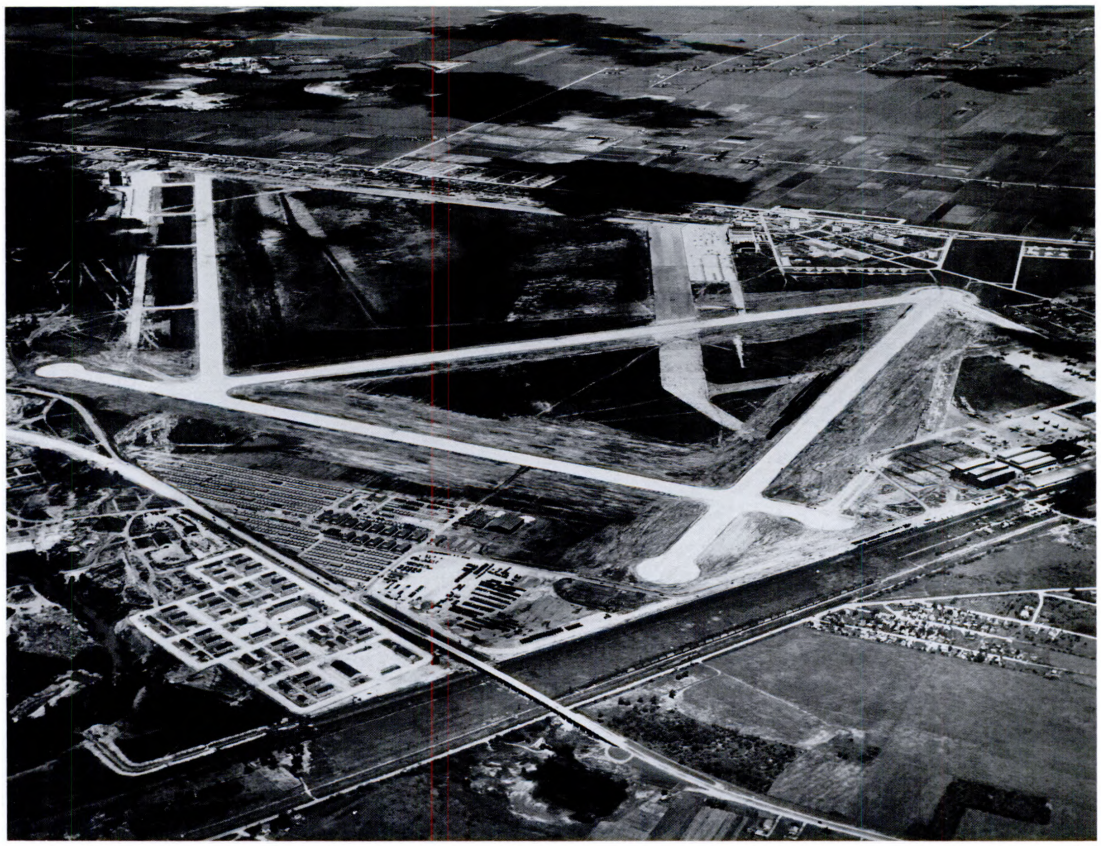

Kelly and Duncan Fields in 1938.

The First Runways

Until the end of the 1930s runways were not an important part of either the Kelly or Duncan Field landscape. Although a thirty-foot-wide concrete and asphalt strip was laid parallel to the Kelly flight line in 1925, it was used mainly as a parking ramp. By 1941 it had been widened to some three hundred feet and was 5,839 feet long and is often misidentified as a runway in some accounts. But student pilots still took off and landed on the wide expanse of grass to the south and east of the Kelly hangars. By this time, though, two actual runways did exist on Kelly. One ran some 3,600 feet roughly northwest to southeast from the east end of the ramp. It was three hundred feet wide in 1941, and actually crossed the boundary between Kelly and Duncan Fields. The other ran some 1,500 feet from the west end of the ramp, also roughly northwest to southeast. Both are now part of Kelly's ramp and taxiway system.

On Duncan Field, a triangular arrangement of taxiways and ramps existed in 1941. One leg of this triangle ran northeast to southwest from the transient aircraft hangars until it intersected the south end of Kelly's east runway. From this point, a leg ran southeast toward the railroad tracks, where it curved into the third leg. This final leg ran almost due north, crossing the first leg and ending at the old Frio City Road.

Grass fields were perfectly suitable for small training aircraft, but the larger and more powerful planes entering the inventory required runways. Thus, in 1942 construction and extension of the runway systems of both Kelly and Duncan Fields got underway. At the urging of Colonel Harvey Prosser, Commander of the Advanced Flying School, Kelly's east runway was extended to a total of 7,500 feet and became a common runway, shared by both fields. Work also went forward on an extension of Kelly's west runway and the Duncan Field taxiways, so that by the end of 1942 aerial views of the fields took on an entirely new aspect. The empty expanses of grass were gone, bordered and cut by ribbons of concrete. This runway complex would remain essentially unchanged until the construction of an 11,500-foot instrument runway in 1955.

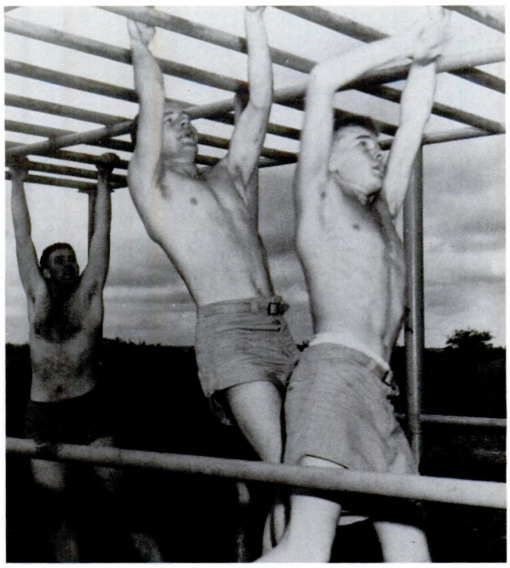

Duncan and Kelly Fields shortly before they were rejoined. The new runway construction is only part of the visible expansion of the two fields.

still new when war broke out. At the same time, facilities to house and train new arrivals simply did not exist; it took time before the Army Air Forces could create a smoothly operating system to sort out recruits and assign them to various specialties.

Selective Service regulations gave the Army Air Forces (AAF) first call on men with any previous aviation experience. This included men whose civilian work was in aircraft manufacture, as well as those with flying experience. By 1942, this meant that a draftee with even a single month of civilian work in almost any facet of aviation was supposed to be slotted for the AAF. Since this policy meant that the AAF got not only most of the technically trained draftees, but also many of the men scoring high on various intelligence and technical exams, the ground forces consistently voiced objections to it. However, except for a brief period in 1943, the policy remained in effect throughout the war.

The development of tests to help identify prospective pilots began in 1941, with the first preliminary test ready by December. Since early navigator, bombardier, and gunner training was incidental to pilot training, planners originally expected to find needed aircrew members from among those who washed out of pilot training. Studies to produce aptitude tests for bombardier and navigator selection did not begin until late in 1941, and Pearl Harbor forced the immediate use of systems that were not completely ready.

At first, Air Corps planners expected the primary flying schools to run a four week orientation program of military and physical training for incoming aviation recruits. By early 1941, however, it was clear that the civilian schools which conducted primary flight training were not equipped to handle this additional burden. So in February, the Air Corps ordered each training center to create a Replacement Training Depot, and in August, the Gulf Coast Training Center formed such a depot under the control of the

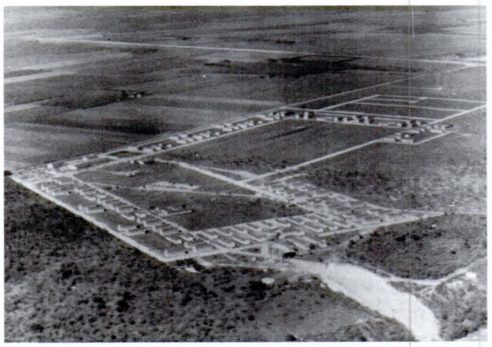

Physical training has always been part of a recruit's life.

Advanced Flying School at Kelly Field. By then construction was already moving forward. With space at a premium, then-Colonel Frank D. Lackland, Commander of the Advanced Flying School at Kelly, urged the use of an area called "The Hill," across Leon Creek to the west of the flight line. The War Department approved construction of sixty-two buildings as early as February, and construction was underway by the end of the summer. In September 1941, the name of the new facility was changed to Air Corps Replacement Training Center (Aircrew). In April 1942, the title changed again, this time to the Army Air Forces Preflight School (Pilot).

There was no set curriculum at first. Instructors taught courses on a variety of subjects, such as military law, customs and courtesies of the service, organization of the Army and the Air Corps, and so on. Much of the emphasis was on physical conditioning and drill. Over time, preflight training was both extended and standardized. By the end of 1942, preflight training was nine weeks long (doubling the original length), and both the academic and physical training followed a rigid schedule. New classes began every four-and-a half weeks, with 18,349 men passing through between November 12, 1941 and July 4, 1942.

Planners initially expected these reception centers to handle all aviation trainees, but in the fall of 1941 separate centers were created for pilots and navigator/bombardiers in an effort to simplify and streamline training. Kelly's Replacement Training Center was designated a pilot preflight center, with future navigators and bombardiers going to Ellington Field for preflight training. But since incoming trainees after mid-January 1942 were all appointed as aircrew trainees, the process was complicated by the need to classify and sort them so they could be sent to the proper training location. This was something the replacement centers were not originally set up to do. At the same time, numerous recruits arrived out of synch with the start of classes and, thus, had to be held in a sort of limbo until they could be sent on. The result was an informal reception and classification "pool" which existed at each of the main training centers. At Kelly the number of men in this pool was so large by early 1942 that several hundred had to be housed at Brooks and Randolph Fields. Facilities on "The Hill" were not finished, and the vast majority of men arriving during the early days lived in tents wherever they were sent.

Although the "pool" was not an official part of the reception process, it proved an opportune time to carry out classification. In April 1942, the Army Air Forces made a virtue out of necessity changing the informal, unofficial "pool" into the Classification Center. At the same time, responding to complaints from the commanders of the flying schools, who found running the reception/classification process a hindrance to operating a flying training center, both the Classification Center and the Replacement Training Center were separated from the Kelly Field command structure and located at the rapidly growing facility on "The Hill." In July 1942, the various programs for reception and classification were incorporated into a new organization called the San Antonio Aviation Cadet Center (SAACC), run directly

Located on "The Hill" west of the Kelly flight line, the San Antonio Aviation Cadet Center later became Lackland Air Force Base.

Expansion and new construction transformed Duncan Field into a modern industrial facility.

by the Gulf Coast Training Center. In November 1944, the AAF consolidated all preflight training at San Antonio, and in 1947 SAACC became Lackland Air Force Base, still the home of all Air Force basic training and the Air Force Officers' Training School.

Depot Expansion on Duncan Field

As Kelly Field struggled to cope with the expansion of training, a little over a mile to the south, the San Antonio Air Depot at Duncan Field was also in the midst of dramatic growth. Greater numbers of aircraft, pilots, and aircrew meant vastly increased maintenance and supply responsibilities, bringing in thousands of new workers and forcing the construction of new facilities.

Maintenance Organization

Maintenance procedures in 1939 were not all that different from those of the 1920s. After experimenting with a system of sending aircraft and engines in for overhaul after a specified number of flying hours, in 1937, the Air Corps returned to the practice of overhauling planes and engines only when visual inspection indicated a need for it. In general, this meant an engine underwent overhaul about every 400 hours, with aircraft overhauls varying depending on the type and function. Trainers, for example, given the hard use they got at the hands of inexperienced pilots, often went into the shop more often than other types of aircraft.

All maintenance was divided into a three tier, or echelon, system. First echelon maintenance consisted of cleaning and routine servicing, such as changing sparkplugs and oiling, and included both twenty and forty-hour inspections. Second echelon maintenance included replacement of parts and some heavy repairs, including partial engine overhauls, and eighty-hour inspections. Maintenance at both the first and second echelon took place at flying fields, but third echelon maintenance took place only at depots--at least in theory. At the depots engines were torn down and rebuilt, and aircraft were completely disassembled, repaired, and put back together. Although the use of metal wings and fuselages was beginning to alter some depot procedures, many aircraft were still fabric-covered as late as 1937, and many basic processes familiar to mechanics of 1920 were still practiced.

In practice, the line between different echelons of maintenance was not always clear. The availability of equipment and the skills of local personnel often

played a larger role in determining the level of maintenance carried out at a particular location. Eventually, Air Force leaders recognized that this gave the maintenance system greater flexibility. In addition, by 1942 the proliferation of repair facilities led to the addition of a fourth echelon. Through the remainder of World War II, first echelon maintenance was defined as that performed by the personnel of the combat unit; second echelon maintenance as the repair work carried out by either the combat unit, air base squadrons, or detachments at commercial airlines; third echelon maintenance as the work done by service groups or sub-depots at flying fields; and fourth echelon maintenance as that done at a specialized depot. To a large extent, the new second and third echelons encompassed the levels of repair formerly included under second echelon maintenance, with the distinction between the two new echelons largely a matter of the kind and transportability of the equipment needed. Normally, second echelon maintenance included work that could be done with hand tools or mobile equipment, while third echelon maintenance normally required bulky, if still moveable, equipment, specialized mechanics, and a limited time for the completion of repairs. In practice, third echelon maintenance sometimes approached the kind of work normally done at a depot.

The Maintenance Command Structure

From 1926 to 1942 the Materiel Division of the Office of the Chief of the Air Corps held responsibility for Air Corps logistics, including supply and maintenance. Headquartered at Wright Field, Ohio, with a liaison office in Washington, D. C., the division also supervised procurement, distribution, and research and development. Supply and maintenance were actually supervised by the division's Field Service Section, which ran four continental air depots. One of these was the Fairfield Air Depot at Patterson Field, Ohio. Two others existed at Middleton, Pennsylvania (Olmstead Field), and Sacramento, California (McClellan Field). The fourth, and largest in terms of responsibility, was the San Antonio Air Depot at Duncan Field.

In 1942, a new facade gave new life to Koerner's 1917 steel-and-concrete hangars. The unique roofline was still visible, however, seventy-five years later.

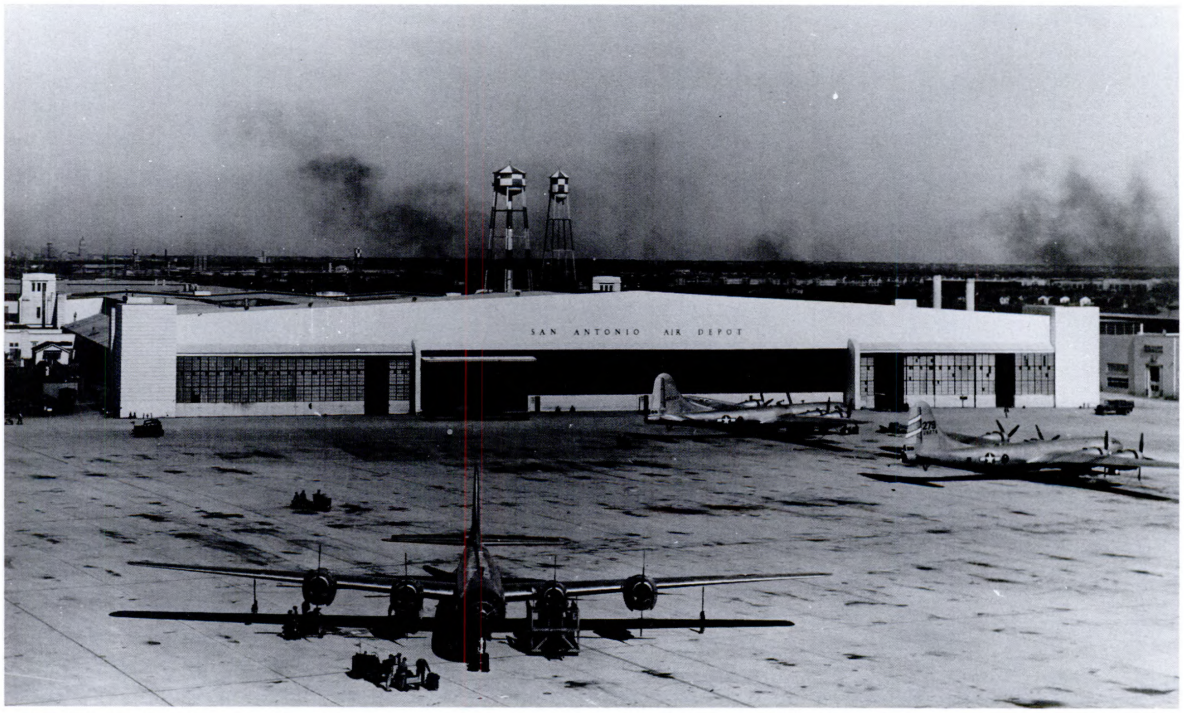

Radio repair was only one of the tasks handled by the Duncan Field Depot.

Creation of General Headquarters Air Force (GHQ AF) to control the combat units of the Air Corps in the mid-1930s, divided some of the responsibility for maintenance. The Field Service Section of the Materiel Division ran the depots and provided technical guidance, but GHQ AF zealously insisted on operating all maintenance activities on its air bases, as well as operating its own separate supply system. In late 1940, the Field Service Section urged greater centralization, an argument reiterated by the Plans Division of the Office of the Chief of the Air Corps. Under the proposal the Plans Division presented, a new "Maintenance Supply Command" would exercise control over all maintenance and supply activities through the creation of four maintenance and supply wings. Although GHQ AF fought this change, the Air Corps moved in its direction in March 1941 with the activation of the "Provisional Maintenance Command," headquartered at Wright Field and commanded by Brigadier General Henry F. C. Miller, the former commander of the San Antonio Air Depot. Each depot now supervised maintenance activities, insofar as it could, within a specified geographic "control area." This new command became permanent a month later, but its jurisdiction remained limited by GHQ AF insistence that control over maintenance stopped "at the Air Base boundary."

The argument over who should control maintenance at different fields continued even after the creation of the Army Air Forces in June 1941. Although Maintenance Command was able to establish some control over maintenance activities at Air Corps bases, such as those run by the training centers (including Kelly, Brooks, and Randolph Fields) throughout the establishment of so-called subdepots, the Air Force Combat Command (successor to GHQ AF) fought against losing any control over maintenance on its own fields. Eventual resolution

By 1944, the San Antonio Air Depot was a control area command with responsibility for maintenance and supply over all of Texas, Arkansas, New Mexico, and Louisiana west of the Mississippi.

of the dispute took place primarily because General Henry H. "Hap" Arnold, elevated to Chief of the Army Air Forces, favored placing all responsibility for maintenance and supply under a single organization. Despite last ditch opposition from Combat Command, the AAF created Air Service Command in October 1941, and gave the new command total control over supply and maintenance beyond the first and second echelon.

During the war, further reorganizations increased central control over maintenance and supply. In December 1941, Air Service Command established four service area commands to supervise depots in specific geographic regions. Under this arrangement, the San Antonio Air Depot was within the Third Air Service Area, headquartered at McDill Field, Florida. Unfortunately, the geographic limits of the service area commands and the control areas of the depots did not always coincide, creating a great deal of confusion over the chain-of-command. To rectify this, in May 1942 the AAF shuffled the area commands so that the geographic boundaries of the service areas and the various depot control areas no longer overlapped, renaming the depots in the process. The San Antonio Air Depot became the San Antonio Air Service Area Command. While this simplified operations and control considerably, the AAF belatedly recognized that the area commands were an unnecessary layer of command. (In addition, calling the depots "area commands," too, added unnecessary semantic confusion.) In early 1943 another reorganization eliminated the area commands, giving the depots--now numbering nine, with two more under construction--area command responsibility. The San Antonio Air Service Area Command became the San Antonio Air Depot Control Area Command on February 1, responsible for all supply and maintenance in Arkansas, Louisiana west of the Mississippi River, New Mexico, and Texas.

The Sub-Depots

The establishment of the Provisional Maintenance Command in 1941 also resulted in the creation of sub-depots administered by the central "control depots." These sub-depots existed to provide support to operating units, although initially GHQ AF would not let them exist on the fields used by the tactical units, and carried out second and third echelon maintenance of equipment and aircraft to the limit of their

Sub-depots, such as this one at Laredo Army Air Field, helped carry the maintenance and supply load.

personnel and facilities. At first, creation of these sub-depots was concentrated within the control areas of only two depots: the Fairfield Depot at Patterson Field, Ohio, and the San Antonio Air Depot. By Pearl Harbor, fifty-seven such sub-depots existed, and the number increased rapidly thereafter, peaking at 238 in 1944. By December 1942, San Antonio alone had activated sixty-two sub-depots, in many cases by having a sub-depot form sub-depots itself. By that time the increase in the number of control depots was already leading to a steady transfer of administrative control over several of them. By the end of April 1943, San Antonio was still responsible for forty-two sub-depots, but on January 1, 1944 all sub-depots at non-Air Service Command fields transferred to the control of the commands operating those fields. This left only four sub-depots under San Antonio control.

With skilled workers at a premium throughout the country, hiring for the sub-depots took time. Recruiting around towns and cities was easier than at more remote locations, and after Pearl Harbor, incoming workers had to agree to accept transfers to any Air Service Command station as a condition of employment. Even so, finding suitable workers remained difficult, particularly given the rapid expansion of the work forces at the control depots themselves and an Air Service Command instruction issued in mid-December 1941 to double the number of workers at sub-depots. Like all other control depots, San Antonio instituted a massive training program, and most sub-depots also provided training. Although the Air Service Command goal was to

employ civilians, military personnel made up most of the workers at first. In a handful of instances, military personnel continued to operate sub-depots well into the war, but as time went on they were replaced by civilians at most locations. Air Service Command used the military personnel freed by this process to form cadres for Service Groups, the military equivalent of a sub-depot, and intended to provide first and second echelon maintenance in the field. In August 1944, the various depots lost all technical control over sub-depots nationwide. The same regulation changed the designation, with sub-depots henceforth known as Army Air Forces Base Supply and Maintenance. The depots role was limited to service and cooperation.

Air Depot Detachments

As early as January 1941, the San Antonio Air Depot was responsible for maintenance at civilian primary schools which did not have contracts for the overhaul of their aircraft. The depot also provided supplies and performed maintenance of lend-lease equipment at schools within the control area training flyers for the Royal Air Force. In February 1942, the relationship between the depot and British training schools was tightened, and the depot took over full responsibility for maintenance inspections and overhauls. Teams of one officer and up to seven civilians were assigned to each school. Initially, these were termed Control Depot Representative Offices. In June, however, Air Service Command ordered the depot to activate Air Depot Detachments at all flying training and glider schools within its control area. Three months later, Air Service Command eliminated distinctions between the detachments at the British flying schools and other Air Depot Detachments, and defined more fully the size and composition of all such detachments. In addition, detachments were set up at commercial airline overhaul agencies carrying out fourth echelon repairs (i.e. major repair or overhaul of aircraft or engines) under contracts with Air Transport Command and Troop Carrier Command.

By the end of 1942, a typical Air Depot Detachment numbered between four and seven workers, including an officer (who acted as the depot's contracting and purchasing representative), at least one civilian aircraft or engine inspector, a civilian supply representative, and civilian clerical staff. The civilians were carried on the payroll of the nearest sub-depot, but all military personnel were assigned to the depot headquarters and placed on detached service. In March 1943, the San Antonio Air Depot Control Area Command had responsibility for some forty-nine Air Depot Detachments, many of which

Brigadier General George H. Beverley

George Beverley began his military career in 1917, attending ground school at the University of Texas before moving to Kelly Field where he earned his wings on July 23, 1918. He left the Army in October 1919 for a year and then joined again, coming back to Kelly in 1922 with the Advanced Flying School. In 1923, he participated in General "Billy" Mitchell's experimental bombing of two naval ships, helping to send one of them to the bottom of the sea. After a variety of assignments, Beverley returned to the Advanced Flying School at Kelly in 1928. In the 1930s, he attended the Air Corps Tactical School and Command and General Staff School, flew mail during the Army pilots' stint as "postmen," and served in Panama and Patterson Field in Ohio. During World War II, Beverley served in the 12th Air Force under Jimmy Doolittle and became Commander of the Second Air Service Area Command. After various assignments in Europe, he returned to Kelly Field and assumed command of the San Antonio Air Technical Service Command on April 10, 1945. For two years, he directed the conversion of the world's largest air depot to an efficient, peacetime base for logistical support.

Station "X"

In late 1942, just over a thousand Kelly-trained specialists arrived in Burtonwood, England, to establish an overseas repair and supply depot. For security reasons, the facility was identified during the war only as "Station X," and references in the Kelly Field paper to the arrival and departure of people from overseas often included this mysterious sounding code name. In 1944, Burtonwood was designated as the supply control depot for the European Theatre, with the responsibility for receiving and processing all requisitions for supplies coming from the United States. In addition, along with another English depot at Warton, Burtonwood carried out depot level repair of bombers and transports (Warton concentrated mainly on fighters), allowing the depot groups with the flying units to concentrate on getting less damaged aircraft back into action as quickly as possible.. At the end of the war, Burtonwood closed down, and the secret of "Station X" was revealed. But in 1948, when the Air Force needed an overseas location to service the transports used in the Berlin Airlift, Burtonwood reopened, and the English countryside was once again invaded by Stetson-hatted Texans from Kelly.

were actually outside the boundaries of the official control area. However, partly as the result of complaints about this situation, command responsibility for all but four of these detachments was shifted to the training commands in early 1944. Of the four which remained under San Antonio's control, three were detachments at commercial firms in San Antonio, Dallas, Texas, and Shreveport, Louisiana. The fourth was a detachment at Wichita Falls, Texas, and it was deactivated at the end of February 1944. As the contracts with the commercial firms at the other locations expired, the associated detachments were also deactivated, with the final two air depot detachments controlled by San Antonio ceasing operations in mid-July.

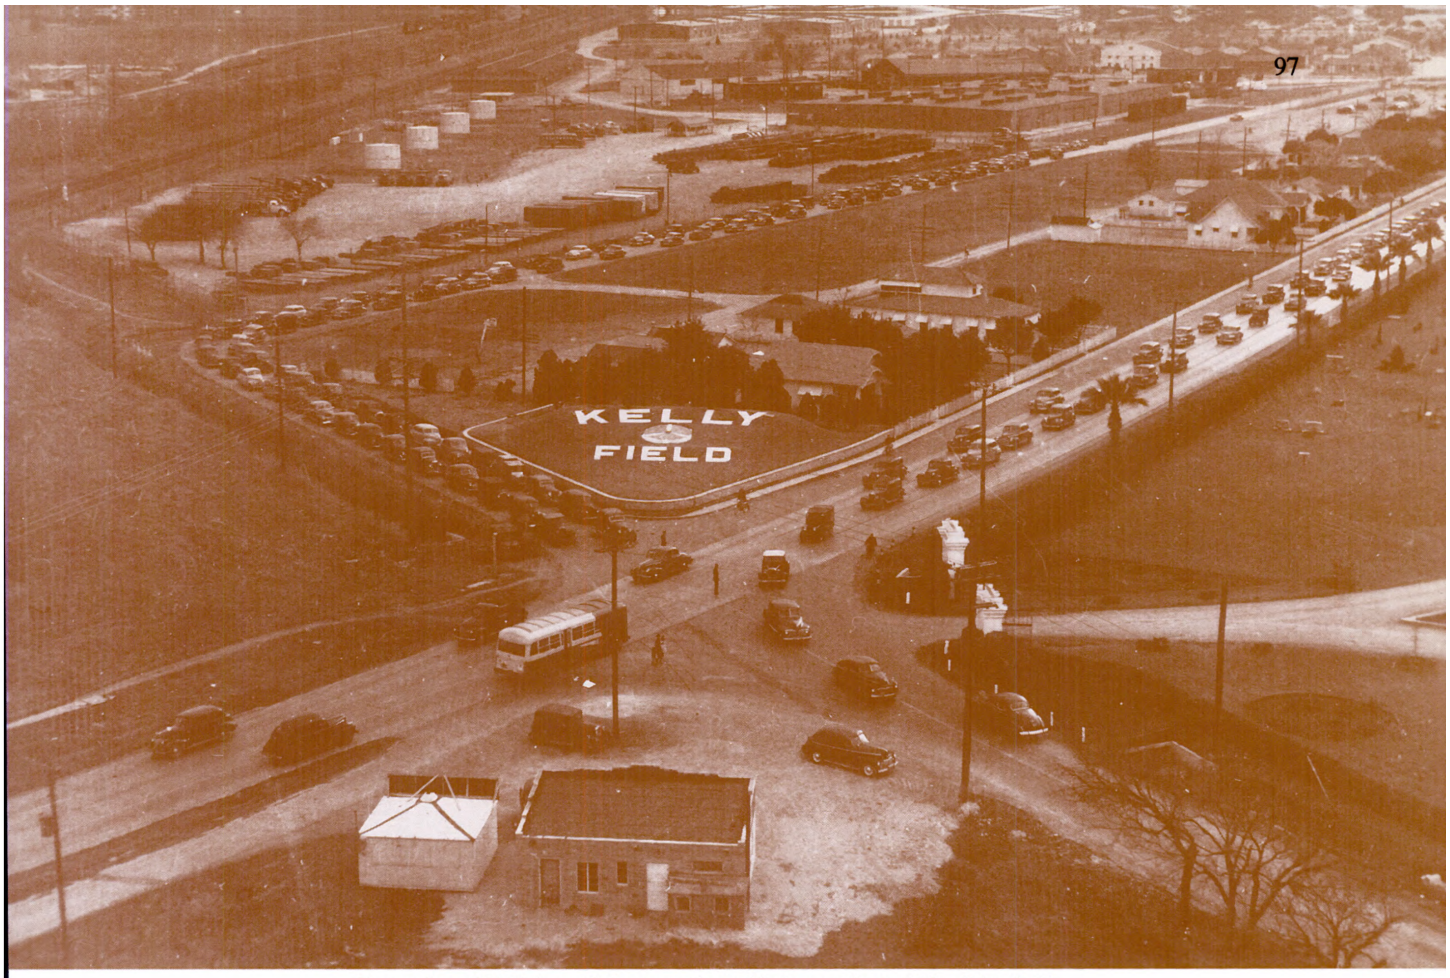

Personnel Acquisition and Training

The growth of civilian strength at Duncan Field was slow but steady during the first years of expansion. Between January 1939 and December 1940, civilian strength grew from 918 to 1,593 in a series of incremental increases. But, during 1941, the pace of civilian hiring began to mushroom. In January 1941 there were 1,867 civilian workers at the depot; by August this number had leaped to 5,126. Yet, impressive as this increase was, it would be dwarfed by the increases which would follow.

In 1939, civilian personnel at the depot were hired through the local civil service board located at Fort Sam Houston. By August, over half of this board's effort was directed toward filling positions at Duncan Field, and in September a board staffed by the San Antonio Air Depot took over responsibility for examining candidates for these positions. At first this was a part-time job for the board members, but by 1940 it was rapidly becoming a full-time effort and the Depot Civil Service Board relocated to the field. In 1941, this board was replaced by a permanent War Department Civil Service Personnel Field Office which began handling the procurement of workers for the entire control area in May. Eventually, civilian strength would peak at some 40,000 in February 1943 at all installations in the control area. The number of civilians at the depot itself, however, did not actually peak, at some 22,117, until 1945. One reason for this is that over the last two years of the war San Antonio gradually lost a number of subordinate and satellite installations, with many functions increasingly centralized at the depot.

The San Antonio depot faced a number of problems in coping with the influx of new workers. Many of them were subject to the draft, making turnover high. Air Service Command regulations forced the depot to seek adjustments to various personnel categories to meet unforeseen needs, and many of the newer employees were inexperienced. Providing training for them proved a particularly difficult problem.

During the 1930s, the training of new employees was largely done through on-the-job instruction. The Depression meant a relative surplus of employees with at least some experience; depot employment needs were small, and it was easy to integrate the handful of new employees into the work force. In February 1940, the Air Corps Materiel Division set the number of positions at different skill levels and pay grades, calling for seventy percent of civilians hired in the depot engineering department to fit within the category of "journeyman and junior mechanics." The maximum number of "senior" employees was set at ten percent, leaving room for only some twenty percent of the positions for relatively unskilled and inexperienced workers. By the end of 1940, however, it was clear that the increasing number of less skilled workers coming into government service was far greater than the existing system

Expansion of Kelly's work force made traffic jams a fact of life at the field.

would allow. Depot Commander Colonel Henry J. F. Miller, later Commander of Maintenance Command, argued that the entire complement of the engineering department needed to be set up on a different basis to give greater flexibility in hiring.

In January 1941, Air Corps Materiel Division revised the established personnel percentages for the engineering department of the depot very much along the lines recommended by Colonel Miller, and in February revised the schedule of complements for headquarters and depot supply departments to match this. However, while this did create somewhat greater flexibility, it did not completely solve all the problems. By May 1941, the pressure to bring in new workers forced Maintenance Command to lift all restrictions and allow depots to amend local complement structures as necessary.

After Pearl Harbor, even this was not enough. By the beginning of 1942, depots had authority to hire in whatever numbers and at whatever skill levels they could. One consequence of this was a rapid increase in the number of women employed at the depot; a demographic shift echoed throughout the country. By the end of 1942 some twenty-seven percent of the depot work force were women.

As the number of relatively unskilled employees at the depot increased, it also became clear that the dilution of the work force created by their presence meant that on-the-job training was no longer practical. Instead, the depot pioneered a program of pre-employment training from the beginning of 1941. Although the depot tried to develop a training plan in concert with city and state agencies, this effort toward cooperation broke down, and in the spring the depot simply went ahead on its own. In May, Mr. A. T. Economy, foreman of the Electrical Department, became head of what was called the San Antonio Aircraft School. Established in rented facilities off-base, the school attracted an immediate surge of enrollment; 2,500 students were taking classes in a three-month program by July. These students were not compensated for their class time, but under the urging of Depot Commander Colonel C. McMullen, Air Service Command authorized paying them under the designation "student-trainee" in October 1941.

Kelly workers line up for a meal from one of the many mobile canteens used at the field.

By this time enrollment had reached 4,724 students, with a total of some 6,956 either in training or already at work. By this time, too, the school was called the San Antonio Depot School, and it moved to Duncan Field in October. Maintenance Command did not create a training program of its own until September 1941, and the program which emerged was modeled after that created in San Antonio.

In January 1942, the Texas Board for Vocational Education finally reached an agreement with the depot and the city of San Antonio to assist in the training and certification of instructors. About fifty of the "oldest and best" men in the depot school received six months of combined classroom and practical instruction under this program. They were exposed to all theories of teaching as well as practicing their skills in shop settings, and for part of the

Payday at the depot near the end of the war.

Brigadier General Morris Berman

Spanning over three decades, Morris Berman's career is a military success story--from private to general. He enlisted in the Army in 1912, rising to the rank of sergeant. In 1917, he was commissioned as a second lieutenant in the Aviation Section of the Signal Corps, learning to fly in Florida before coming to Kelly Field for the first time in 1922. After graduation from the Advanced Flying School, he served as Kelly Field's adjutant until late 1923. After a variety of assignments, including first commander of the new Randolph Field, Berman returned to Kelly as the field's supply officer. From 1934 to 1937, he was the executive officer at the San Antonio Air Depot on Duncan Field. In 1940, Berman was sent to Hill Field, Utah, to build the new depot there. He is still regarded as the "Father of Hill Field." General Berman returned briefly to command Kelly in 1944 before going overseas to take charge of Burtonwood Air Depot in England. He died in 1945. His private-to-general rise was an inspiration to all servicemen.

time had the benefit of technical instruction by professors from Texas A & M University. By February 1942, the program was also training instructors for the sub-depots and providing instructional materials. As early as August, the San Antonio Air Depot had printed and distributed over 234,000 technical and administrative manuals for some 173 different courses.

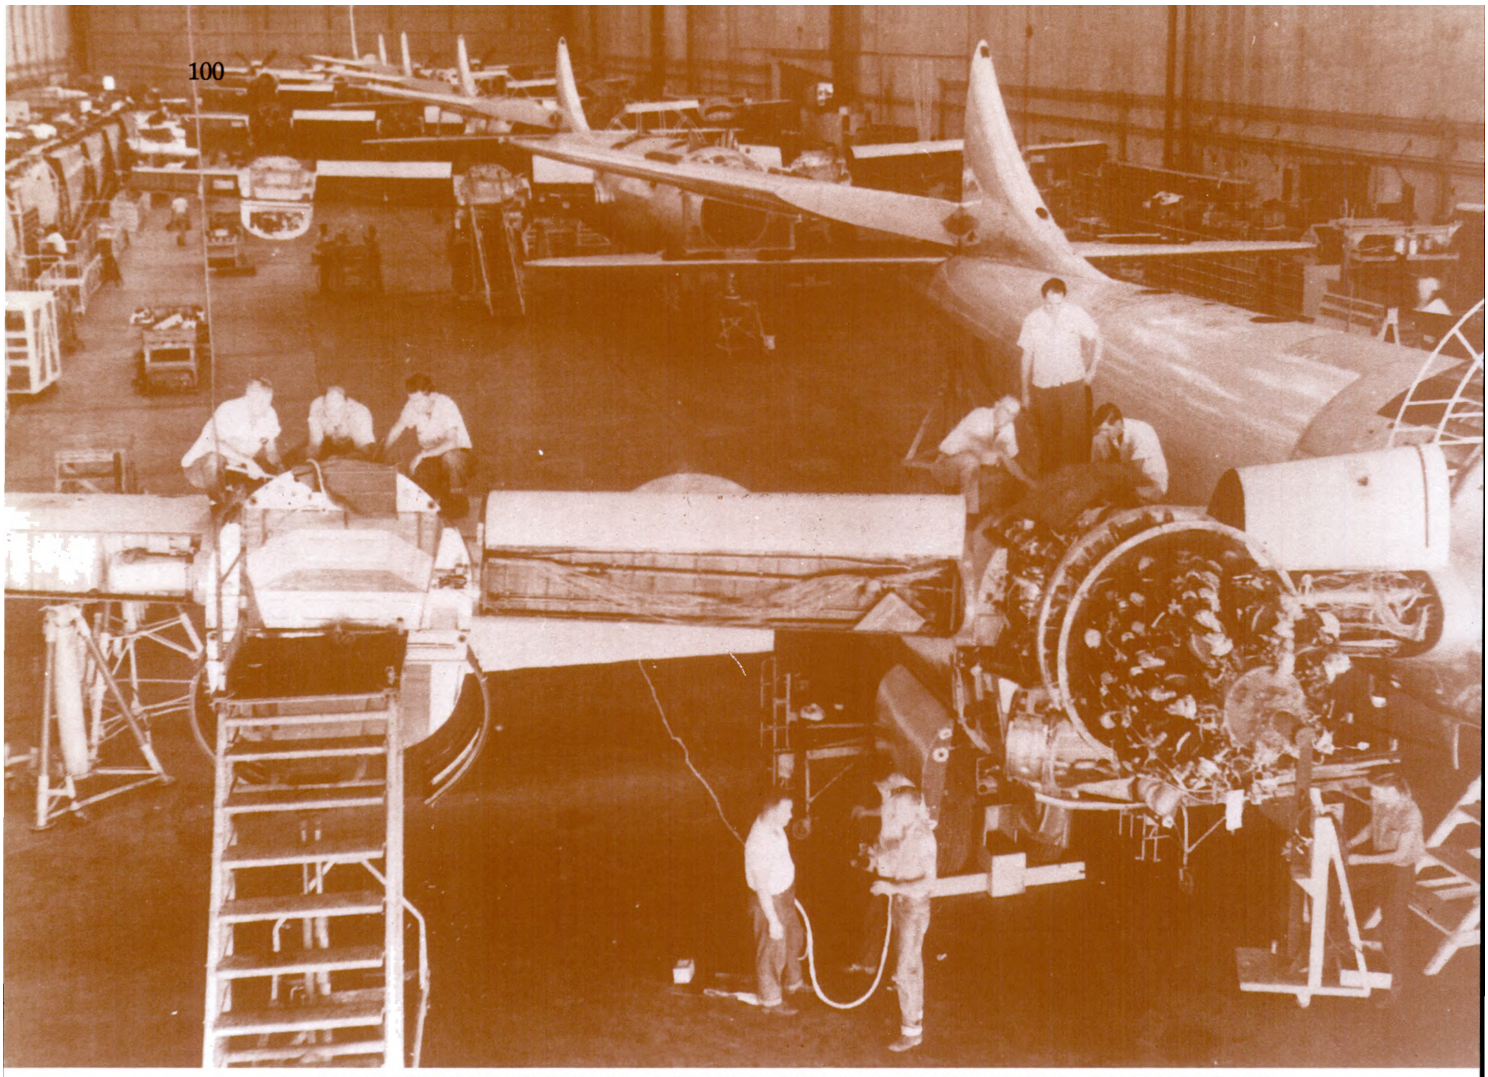

As civilian strength neared its peak, the need for pre-employment training began to wane. By the end of 1943, on-the-job training once more seemed a practical alternative. Air Service Command was, by now, committed to some form of pre-employment training, and was reluctant to end it altogether. And, by March 1944, the San Antonio Air Depot Control Area Command, after a brief experiment with older training methods, was forced to reestablish pre-employment training, albeit on a much smaller scale.

Military Training

Individual training of ground technicians, including mechanics and supply specialists, was the responsibility of Technical Training Command (merged in 1943 with Flying Training Command to form, simply, Training Command). Aircraft mechanics went through a basic aircraft mechanics course which was shortened from thirty-eight weeks in 1939 to 112 days by 1943. In addition, through association with private companies, colleges, and other agencies, the AAF also offered specialized courses in armament servicing, engine repair, electrical systems, and a variety of other subjects. At the end of their individual training, ground technicians were theoretically capable of performing first, second, or third echelon maintenance on the system of their specialty.

During the war, large numbers of women joined the Kelly work force. Collectively they were called "Kelly Katies."

By the end of World War II, Kelly aircraft overhaul efforts concentrated on B-29s destined for the Pacific.

Although many of these individually trained technicians were eventually assigned to combat organizations to provide first and second echelon service, most were assigned to service and depot groups. These latter organizations provided third and fourth echelon support of combat units overseas, and their personnel were, because of the level of support involved, trained by Air Service Command. This not only created jurisdictional arguments between Training Command and Air Service Command, it also posed problems for the depots; they had to fit this training around their regular operations.

No precedent and no fully-developed plan existed for the training of air depot or air service groups when the San Antonio Air Depot activated the 3rd and 5th Depot Groups in May 1941. Most of the men assigned to these organizations already had some second and third echelon maintenance experience from prior service with Flying Training Command. For several months, the members of both groups gained experience with depot procedures through on-the-job training alongside depot civilian employees. Although the 5th Depot Group went to the new Warner-Robins Depot in December 1941, the 3rd did not ship out until it headed overseas in March 1942. By then, the San Antonio Air Depot had already activated seven more such groups, and had begun to establish a consistent training regimen.

The creation of a Training and Liaison Office in March 1942 provided some central control over the training process, which remained on-the-job training. Although working alongside the permanent depot work force did provide a daily experience of depot procedures, the training of military personnel alongside civilian employees created friction since the two groups worked similar hours but under vastly different rules. Eventually, the entire night shift from 10:45 PM to 6:45 AM was set aside for military training, but this was at best a partial solution. Night work was limited in variety and amount, and it was impossible to train the military groups in the appropriate clerical and administrative tasks since

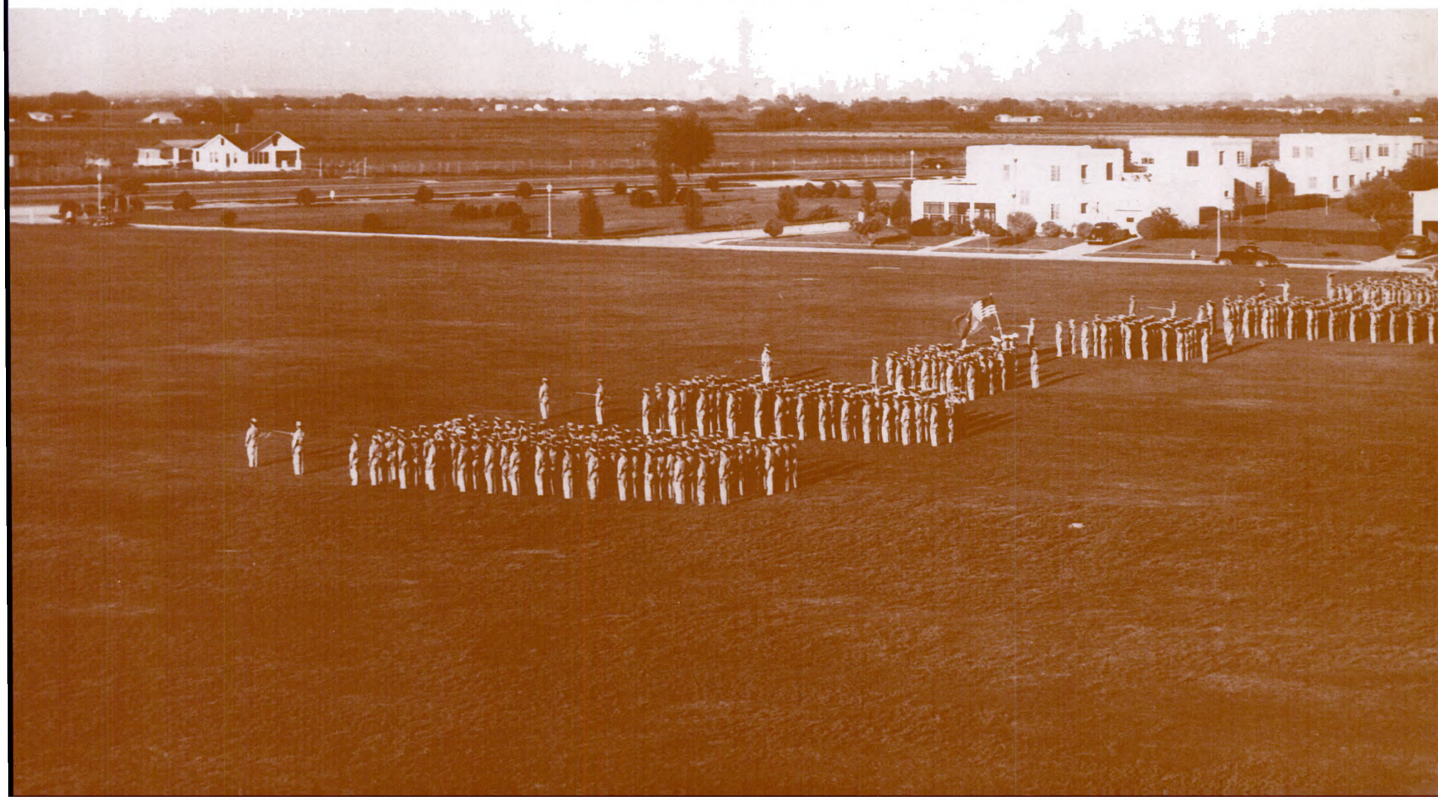

depot practices in these areas differed significantly from the practices in the field. The eventual solution was to set up entirely different depot training groups, physically separated from the civilian depot shops and devoted solely to preparing military groups for their specific jobs. This did not eliminate all problems, especially the shortage of the kind of combat aircraft these men would work on in the field, but it did go far in resolving the majority of the most pressing difficulties experienced in trying to train military personnel while the civilian shop workers continued to carry on regular maintenance.

The Consolidation of Duncan and Kelly Fields

By the end of 1942, the expansion of depot activities meant increasing aerial congestion over Duncan and Kelly Fields. Student-flyers at Kelly usually took off to the south, crossing over the Duncan flight path and creating increasingly hazardous conditions. By this time, too, Kelly Field no longer played a paramount role in flying training; the opening of numerous other advanced bases throughout the country meant that Kelly's flying training load could easily be absorbed elsewhere. Relocating or building a large depot industrial facility from scratch was far more difficult, not withstanding the establishment of the new depots since 1940. In December 1942, Colonel Paul Wilkins, Commander of the San Antonio Air Depot, wrote to Brigadier General L. P. Whitten, the Director of AAF Base Services, to argue that a partial allocation of Kelly Field to Duncan Field, and the construction of new runways, would "postpone but not prevent a ... disaster." Under existing circumstances, Wilkins claimed, "Duncan Field cannot efficiently carry out its assigned program." The only realistic answer was expansion, and "the only satisfactory expansion is the absorption of Kelly Field" in its entirety. General Whitten and the AAF high command agreed, notifying Air Service Command on January 4, 1943 that "consolidation of Duncan Field and Kelly Field into one reservation has been approved by this headquarters."

Local preparations for the merger began almost immediately, but the actual transfer did not occur until April 21, giving time for training operations at Kelly to slowly wind down and for a boundary to be set between the former flying field and the San Antonio Aviation Cadet Center, now firmly established to the west of Leon Creek. Indeed, even before the official consolidation date, a number of hangars, barracks, and other buildings were turned over to the depot. Although there was some consideration for naming the newly merged fields in honor of Major Duncan, sentiment and tradition were among the factors which persuaded the AAF to keep the name Kelly Field. As Colonel Wilkins pointed out, "the

The training of military depot groups was an important mission during World War II.

original Kelly Field [Kelly Number 1] is Duncan Field," and it made historic sense to unite the fields under the older and more famous name. Nevertheless, the 1943 merger marked a departure from both history and tradition. After twenty-six years as one of the country's most important flying training fields, and two decades as the "finishing school" for Army pilots, Kelly's mission would henceforth be supply and maintenance.

Reorganization and Restructuring

Even before the merger of Kelly and Duncan Fields, the AAF undertook another reorganization of its maintenance and supply arrangement, abandoning Air Service Area Commands in favor of Depot Control Area Commands in February 1943. Under this reorganization, the San Antonio Air Depot became the San Antonio Depot Control Area Command, exercising both depot and command functions. Less than four months later, in May, the depot became the San Antonio Air Service Command, a name change that did not alter its responsibilities. This does not mean, though, that internally the organization of the depot remained unchanged. Indeed, restructuring within the depot was constant

Brigadier General Paul C. Wilkins commanded the depot during the consolidation of Kelly and Duncan Fields.

How's the Weather, Ma'am?

That phrase echoed throughout the later years of World War II, particularly at Kelly Field. The 3rd Weather Region, headquartered at Kelly Field, decided to create an all-Women's Army Corps (WAC) weather station, freeing more men for duty overseas. All "Weather WACs" in the 3rd Region were ordered to Kelly in July 1944. The WACs accomplished this mission without any formal training, since most of the training for the WACs was completed "in-station," or on-the-job.

The weather station at Kelly operated around-the-clock. The WACs deciphered coded reports from the station's teletype machines, which received information from stations all over the United States, Canada, Mexico, Central America, and islands in the Atlantic and Pacific Oceans. A WAC's observation duties included reading thermometers, psychrometers, and conducting winds aloft observations, which told wind direction and speed at different altitudes. The information received from the teletype machines was then combined with the information gathered at the weather station to forecast the weather. The WACs did this by accurately plotting precipitation, fronts, and high and low pressure areas on synoptic maps for use by both pilots and navigators. The forecaster would also post her forecast for the various flying patterns and altitudes.

By the end of the war, only weather personnel who had been overseas or had enough points for length of service were eligible for discharge. Kelly's weather station began getting a stream of male weather observers, and forecasters who worked with the WACs until they received their discharges. The dedication displayed by the Kelly Field "Weather WACs" during the war exemplifies the commitment Kellyites have had for three quarters of a century.

during the war, with new offices proliferating, especially early in the war when expansion was particularly rapid. Organization charts for much of the early war period are, as the historian of that period lamented, "non-existent." Headquarters organization was "completely fluid," and only in the supply area did the basic structure tend to remain constant. Even here, though, the surge of new workers, and the addition of hundreds of new items of equipment, forced the development of new methods of counting, storing, and retrieving material.

In July 1944, the AAF formed the Materiel and Services Command by combining the Materiel Command with the Air Service Command. On September 1, 1944, the new organization was redesignated the AAF Air Technical Service Command. As a result, the San Antonio Air Service Command became the San Antonio Air Technical Service Command. By this time Kelly Field was earmarked as a key depot for the overhaul of B-29 heavy bombers and the R-3350 engines that powered them. Full production facilities did not exist at the field until mid-1945, but ten days after Kelly workers finished overhauling their first R-3350 forty-five more were under repair and the assembly line was operating around the clock.

Warehousing and the Acquisition of Normoyle Quartermaster Depot

By 1944, the accumulated materiel at the depot was straining available storage space. The merger of Kelly and Duncan Fields provided some space, as did the construction of six enclosed warehouses and six open-air storage sheds north and east of the old Kelly Number 2 flight line. But these buildings were soon jammed as well. As long as the depot operated or

In 1945 Normoyle Quartermaster Depot became East Kelly.

Warehouse space was in short supply by 1944.

administered sub-depots and other satellite facilities, it had been possible to store many items elsewhere. The steady consolidation of more and more activities at the depot itself simply emphasized the fact that construction had never fully kept pace with expansion, a situation compounded when the Army Air Forces ceased funding any new construction projects after Germany surrendered in May 1945. In June, the AAF deactivated the specialized depot at the former Normoyle Quartermaster Depot just to the east of Kelly, and consolidated this installation with Kelly Field under the designation East Kelly. Normoyle's warehouses and other facilities were a welcome addition to those at Kelly, but its acquisition by the depot did not end the shortage of warehouse space.

Victory

In August 1945, the dropping of atomic bombs on Hiroshima and Nagasaki triggered the surrender of Imperial Japan. Although the end of the war could be sensed, and ever since the surrender of Nazi Germany the previous May there had been a steady contraction of work load and personnel, the final end came with dramatic suddenness. Shipments destined for the Far East abruptly stopped; all overhaul of aircraft, engines, and equipment (aside from cargo aircraft) ceased immediately; civilian work force cutbacks began at once. Surprisingly, resignations were far higher than anyone anticipated as workers, including thousands of women, returned to peacetime pursuits. Arbitrary cuts in the civilian work force did not have to begin until October. By then the civilian strength of the depot work force had fallen from around 19,200 in July to just 14,941, and was continuing to drop.

For the short run, Kelly's exact role was uncertain. Flying training was now conducted elsewhere; operational units that remained activated were stationed at other fields; the size and scope of depot operations were undefined. There was no doubt that Kelly would continue to be an important part of American defense, but as the nation and the military groped their way into an uncertain future--at once unknown and bright with promise--no one could say exactly what changes were still to come.

VICTORY EXTRA

ALLIES WIN V-E

The Flying Times

Vol. 4—No. 10
May 8, 1945

Warmly elated over Germany's unconditional surrender to the Allies, 25,000 Kelly Field soldiers and war workers flocked to V-E-Day ceremonies this morning, then immediately afterward returned to their training and jobs to fulfill their obligation to the fighting men in the Pacific.

The surrender, announced at 8 a. m. Kelly Field Time by President Harry S. Truman, followed a flood of reports of the Nazis' capitulation which had GIs and war workers keyed to a high pitch of excitement. Crowds at the ceremonies, highly enthusiastic yesterday, reacted calmly today when the official communique on the European war was recited.

The Associated Press Staff first broke the news. The Germans signed the papers by which they laid down their arms at 19 minutes before 3 a. m yesterday, French time, in a little red school house at Reims, France.

That's where General Ike has his headquarters.

The Allied capitals went wild over the news. In London, the crowds jammed Piccadilly Circus. And New York is staging one of its biggest ticker tape celebrations.

Here's how the news of Germany's unconditional surrender unfolded yesterday.

It began with a Danish broadcast that Norway had been surrendered unconditionally by the Nazis.

Then the new German Foreign Minister, Ludwig Schwerin Von Krosick, said in a broadcast to Germany that—"After almost six years of struggle, we have succumbed."

Von Krosick said that Admiral Doenitz had ordered the unconditional surrender of all fighting German troops, including all Nazi U-boats. Then at 9:35 a. m. yesterday came the Associated Press flash from Reims, France, telling of the signing of the unconditional surrender at General Eisenhower's headquarters. Germany had given up to the Western Allies and to Russia.

President Truman proclaimed complete and unconditional victory in Europe. In a VE proclamation, the President said that our blows will continue until the Japanese also lay down their arms in unconditional surrender. The president said next Sunday, Mother's day, is a day of prayer in which he wanted all to join.

At last reports the Americans were approaching Prague, with the Russians about 50 miles away on the other side. It is entirely possible that fighting will continue there for some days. German communications are so chaotic that the order from the High Command to surrender may not be received immediately by many units in the field.

While the Allied world jubilantly hailed the momentous news, there remained a grim reminder out in the Pacific that another big war still looms ahead.

Military and civilian speakers set this dominating theme at the Kelly Field rallies. It was best summed up by Brig. Gen. George H. Beverley, SAATSC Commanding General, who stated:

"Above all, today, all fighting Americans—each soldier in our ranks, each war worker on our production and supply lines—every man, woman and child must make a grim resolution. For this is the day on which, by word, by action and by deed, we must assure our embattled forces on the other side of the Pacific that we will see them through to final victory over the despicable Jap."

Chaplains opened the ceremonies with prayer—giving thanks to God for His help and guidance in the past and beseeching His protection for American soldiers and their Allies who still must fight in the Pacific.

The terms of the surrender imposed on Germany have not yet been announced. But the Nazis, who began the war and caused 40,000,000 casualties in the global conflict, surrendered with pleas to the victors for mercy. In his broadcast to the Germans, the German surrender Foreign Minister, Von Krosick, said: "Nobody must deceive himself over the harshness of the conditions. We had to accept them."

Defeat of the German Army climaxed almost six years of violent, bitter fighting which has engulfed all but a very few of the nations of the

CHAPTER FIVE

From Independence to Dominance:

The Cold War Years

Legacy of the Second World War

Dismantling the Machinery of War

Even before President Harry S. Truman announced V-J Day on August 14, 1945, the Air Technical Service Command (ATSC) at Patterson Field, Ohio, had begun preparing for peace. With the war rapidly coming to a close, the Army Air Forces found itself with more personnel, more aircraft, more air fields, and more equipment than it thought it would ever need. On August 12, ATSC directed its depots to stop repairing all but cargo aircraft and instructed the depots to release all civilian personnel except those working on transports and associated systems or needed to store aircraft and equipment.

San Antonio Air Technical Service Command (SAATSC) returned to peacetime operations with a jolt. One of the first steps SAATSC took was to cut its work week back to forty hours, starting Monday, August 27. September 1 was the first non-working Saturday since the war began. Maintenance priorities shifted from the B-29 bomber and R3350 engine to C-46, C-47, and C-54 transports and their R2000 engines. The Supply Division discontinued all overseas shipments except those in support of Air Transport Command, the Army Airways Communications Service, and the Weather Service. Aircraft and equipment storage and disposal became growing concerns.

With the declaration of victory over Japan, troops arriving at Kelly were screened. Those having high service points, or over the age limit, were discharged. Those not so lucky were assigned to base squadrons.

Facing Page: Engineers at Kelly pioneered the use of pressurized "cans" for the storage and shipment of engines.

Physicals, at least as thorough as the ones given upon entering the Army, were given to the men who were finally on their way home after World War II. Processing for separation included a fitting for a new uniform, and one final trip to the paymaster.

The need for thousands upon thousands of civilian workers disappeared. Within a week of V-J Day, Kelly's Civilian Personnel Office received 536 resignations, 202 of whom were "Kelly Katies." By the end of August, SAATSC received instructions to implement a reduction-in-force (RIF), which called for a 3,100 cut in authorizations by the end of September; 1,550 by November 1; 1,575 by December; and another 666 by January 1, 1946. Voluntary resignations covered the first 3,100-position cut, but RIF procedures were needed to meet the other personnel reductions. Kelly's civilian manning had dropped from 14,941 in September 1945 to 11,464 in June 1946. The Maintenance Division absorbed a majority of the initial cuts; but Kelly's Supply Division, the second largest organization within SAATSC, took its fair share.

With victory achieved, the public clamor for rapid demobilization was persistent and loud. By September 1945, an extensive separation program for military personnel had sprung up. One hundred fifty-five separation centers opened around the United States, including Randolph Field and the San Antonio Aviation Cadet Center. But these centers couldn't out process people fast enough. As the number of personnel eligible for demobilization mounted, more separation centers opened. With a backlog of approximately 3,000 enlisted men and fifteen officers waiting to leave the service, SAATSC established its own separation point on East Kelly. The 4505th Army Air Force Base Unit operated the center for about fifty days, discharging an average of 100 men a day. By the time Kelly's separation center closed on November 24, it had processed 122 officers and 3,851 enlisted men, completely eliminating SAATSC's backlog. Between September 1945 and June 1946, Kelly's officer manning dropped from 1,066 to 450, while the number of enlisted men assigned plummeted from 15,180 to 2,019.

Innumerable, daunting tasks faced those logistical organizations given the job of dismantling America's machinery of war. Glutted supply pipelines connecting Army Air Force units around the world had to be cleared. Air fields and stations had to be closed. Enormous quantities of material from all parts of the globe had to be sent back to the United States. Contracts had to be cancelled and all manufacture of Air Force goods halted. Millions upon millions of dollars of surplus supplies, material, and aircraft had to be disposed of, turned over to the War Assets Administration, or identified and stored.

Air Materiel Command (AMC) and ATSC shared responsibility for disposing surplus Army Air Force property with two other governmental agencies, which unfortunately were ill prepared for the enormous volume of surplus goods that quickly piled up. As of June 1945, ATSC had declared $133 million worth of property as surplus, but the Surplus War Property Board had only disposed of materiel worth $17.5 million. By December 1945, ATSC found itself with over $960 million worth of surplus property.

When covered storage ran out, material was covered with tarpaulins and routed to its next destination as soon as possible.

Tractors as well as aircraft began stacking up at Kelly after the war.

San Antonio Air Technical Service Command's Supply Division had to receive, store, administratively manage, and dispose of the surplus and salvageable material that arrived at Kelly. In fact, disposal of this property became such a major function that it seemed the division's mission changed from that of supplying material to disposing of it. The arrival of enormous amounts of surplus and salvageable property created an immense backlog of material for disposal and a critical need for storage space. Most of this material had to be screened and classified, a time consuming job for which SAATSC was undermanned. Supply Division managers opened five large salvage yards and five warehouses on North Kelly and used two other buildings for storage on East Kelly.

To speed disposal of salvageable material, SAATSC created a Small Lots Sales Office in January 1946. In the first six months of the year, sales at the new office jumped from $4,000 to $58,800. Lingering shortages of copper, lead, steel and other metals in the civilian economy increased the demand for salvaged material, and all military services took advantage of that demand to unload their surpluses. In addition, the government gave as much material as it could to schools, the Civil Air Patrol, the Veterans Administration, and other similar organizations. By the end of 1946, Kelly saw a significant reduction in its salvage work load. A backlog of 12,000 tons of salvageable material in July 1946 dropped to a backlog of only 2,500 tons by June 1947.

The situation with surplus material was just as critical. Named as specialized depot for special purpose vehicles (trucks, tractors, forklifts, tugs, and fuel serving units), Kelly received approximately 4,000 freight carloads of these vehicles between October and December 1945. In the last four months of 1945, the Supply Division's Reparable Branch warehouse received 3.5 million pounds of material. If the forms were filled out properly, some of this material was transferred to the War Assets Administration or to salvage. Most went into the reparable backlog. With covered storage space at a premium, most material stayed stacked outside, covered with tarpaulins. The monetary value of the surplus material on hand at Kelly reached a high of $160 million in August 1946. Hard work and dedicated effort brought that down to only $10 million by December 1947.

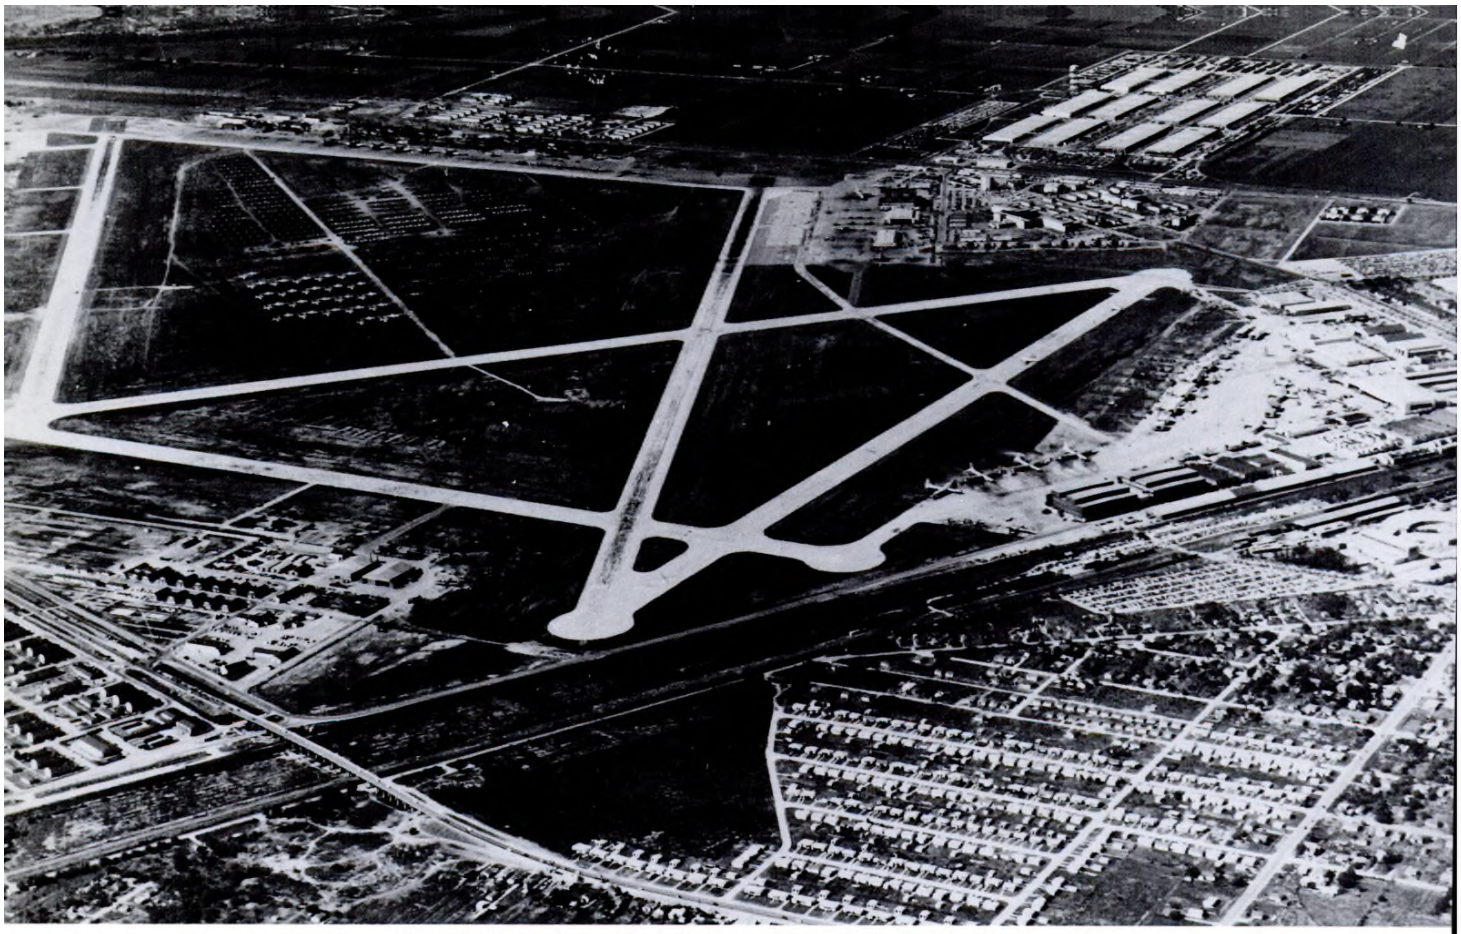

Aircraft Storage

Adequate storage for surplus aircraft was another challenge facing the Army Air Force's logistics commands. From a wartime peak of 80,000 aircraft, the active inventory dropped to only 12,000 airplanes by the middle of 1947. Operational units would use some of the surplus airplanes; Reserve, Air National Guard, and training units would fly others; and foreign countries would buy still more. Nevertheless, many aircraft would stay in storage indefinitely, and maintenance personnel would have to treat each of them for protection against corrosion. As a further complication, there were six times as many aircraft to store as there was available space. By the spring of 1945, ATSC realized it had to acquire new facilities, which had to meet certain criteria: they should be located in dry climates, convenient to staging areas, and they should have a relatively large work force readily available.

Army air fields in the Southwest met the criteria. In October 1945, SAATSC officials began discussions on transferring airfields to their jurisdiction for the storage mission. On November 1, Hobbs Army Airfield, New Mexico, shifted from the Army Air Force Central Flying Command to SAATSC, primarily to store P-51 "Mustangs" and A-26 "Invaders." The 4160th Base Unit moved from Albuquerque, New Mexico, to Hobbs to man the airfield. On November 15, 2nd Air Force transferred two of its fields to SAATSC to store B-29 "Superfortresses:" Pyote Army Airfield, Texas, and Davis-Monthan Field in Tucson, Arizona. Davis-Monthan turned out to be an ideal storage facility; aircraft stored there always stayed in better condition than those stored at other locations. Even when 2nd Air Force's successor, Strategic Air Command, reclaimed the field on March 31, 1946, the ATSC organization remained a tenant at the field.

P-51 "Mustangs" awaiting disposition after the war. Some were turned over to Air National Guard units.

Aircraft storage increasingly became an important mission after the war.

Kelly, too, was a storage site. In September 1945, the south Texas field had approximately 700 B-29s, B-32s, and P-51s in storage. That number dropped to and remained around 500 during 1946, but increased in the fall of 1947 with the inactivation of several airfields around the country, including one of Kelly's installations, Hobbs Army Airfield. Kelly prepared for the influx of approximately 3,000 more aircraft, primarily AT-6 "Texans" and P-51s. The number of aircraft peaked on November 10, 1947, when 2,593 planes rested in row after row on the grassy fields between the runways.

With the closing of other airfields and the additional storage work load, Air Materiel Command told Kelly officials they would pick up another 600 manpower authorizations. Most of these positions went into the Maintenance Division for the storage program since maintaining aircraft in storage was a time consuming job. The hardest part was the initial corrosion treatment, after which each aircraft received weekly, monthly, and ninety-day inspections. At the ninety-day point, workers resprayed the engines with a special rust preventative mix and repainted the tires to prevent them from cracking.

Cocooning

While this method of corrosion treatment worked, it was both time consuming and manpower intensive. AMC desperately needed an inexpensive, long-term solution to the problem of storing the thousands of aircraft left over from the war. In the spring of 1946, the command thought it had found the answer with a new type of spray-on plastic. Command managers selected the B-29 to test this new method called "cocooning." Prior to cocooning, workers spent 100 hours per aircraft per month to maintain a B-29 in storage; AMC officials expected the new method to cut this time to only two hours per aircraft per month.

To cocoon an aircraft, workers washed, cleaned, and completely dried the aircraft. They then taped the frame in a gridwork pattern, sprayed on the webbing solution, reinforced the webbing with two coats of red and yellow plastic solutions and asphalt, and then applied a coat of aluminum spray to reflect heat and light away from the plane. Theoretically, an aircraft cocooned this way could be stored indefinitely. When needed again, workers would remove the webbing, gas and oil the plane, and perform a test flight.

Master Station Plan

By 1945, War Department officials already were planning for the future by directing each installation to prepare a Master Station Plan to plot out a ten-year program for facility and land use, identify temporary buildings to tear down, and map out construction of millions of dollars worth of new permanent buildings in an orderly, predetermined manner. Kelly personnel began working on their ten-year Master Station Plan in the fall of 1945, claiming that when completed, Kelly's plan would identify every future building down to its location and architectural design.

These plans envisioned a much different Kelly, including construction of a giant 50,000-person football stadium, a baseball arena with seating for 5,000, and a 2,500-unit housing program for both officer and enlisted personnel. Plans also called for converting building 1625 (the old miniature range building), into a new, two-winged headquarters facility.

While none of those buildings ever materialized, some of the plans for the "Kelly of the future" did become reality. As early as 1945, Kelly officials realized the runways and depot maintenance facilities built in the '30s and '40s were much too small. They knew they had to reposition and lengthen Kelly's runways, requiring demolition of the old, historic Kelly Number 2 flight line. They planned for construction of the world's largest hangar for depot maintenance of all types of aircraft.

As the chief of Kelly's Air Installation Office stated, "Ten years is really a very short time for planning the world's mightiest air depot, especially with guided missiles, rockets, and atom bombs on the horizon!"

Lieutenant Colonel Glynn O. Mount, Chief Air Installations (second from left); Brigadier General George H. Beverley, San Antonio Air Materiel Area Commander; and Lieutenant General Nathan F. Twining, Commander of Air Materiel Command, discuss Kelly's Master Station Plan with an unknown officer.

The command choice six sites for the project: Davis-Monthan and Pyote Air Fields and San Antonio, Ogden, Sacramento, and Warner Robins Air Materiel Areas.

San Antonio personnel expected the cocooning to begin at Kelly in August; but the contractors actually doing the work had fallen behind. Although cocooning began at Davis-Monthan and Pyote in December 1947, the work at Kelly never started. Contractors cocooned ninety-eight B-29s at Pyote and 455 at Davis-Monthan. But by January 1948, Air Materiel Command officials had become disenchanted with the project and cancelled the contracts in the spring as the Air Force began rebuilding its B-29 fleet. To make matters worse, later in the year, they found it was as difficult and time consuming to remove the cocoon as it was to put it on.

Despite high hopes, the cocooning program never met the command's expectations. However, San Antonio Air Materiel Area (SAAMA) workers devised another storage project during this same time period that did succeed. Instead of storing spare engines in wooden crates, Kelly workers began putting them in metal containers, a procedure which did not require special corrosion treatment for the engines and cost no more than crating. This simple, but highly effective procedure, worked.

Post -War Organizational Changes

San Antonio Air Technical Services Command marked the end of the war by implementing a new organizational structure called the T-system devised by ATSC during the war as the best way to manage an immense industrial wartime logistics organization. Knowing that one man could not control all of the complex, different functions managed by the command, Major General Hugh J. Knerr, ATSC Commanding General, created the positions of deputy commanding generals, technical to manage the various headquarters organizations, such as personnel, plans, intelligence, engineering, and supply. The result was bureaucracy at its best, providing a high degree of flexibility and responsiveness.

Air Technical Services Command began operating under this system in July 1945, and it went into operation at SAATSC on September 1. Since SAATSC was area headquarters, the system differed slightly from that at the headquarters; the functional managers were called "deputies" instead of deputy commanders and the Deputy for Intelligence was abolished as unnecessary for area commands. Initially, SAATSC had four deputies: Personnel (T-1), Engineering (T-3), Supply (T-4), and Plans (T-5). Based on a recommendation of Brigadier General George H. Beverley, SAATSC Commanding General (at that time depot area commanders held the same title as their superior at ATSC), ATSC agreed to the addition of a Deputy for Base Services (T-6) on January 29. To form the new office, the Base Services Division transferred from T-1 and the Air Installation Office moved from T-4. In addition to the offices of the deputies, SAATSC also had four independent staff offices: the Public Relations Office, the Air Inspector, the Judge Advocate, and the Adjutant General (today's Information Management Division).

After changing names four times in as many years, the San Antonio depot changed its name once again in 1946. On March 9, 1946, the Air Technical Services Command became the Air Materiel Command. To reflect the new name of its parent command, on July 2, the San Antonio Air Technical Service Command became the San Antonio Air Materiel Area (SAAMA), a name it would keep for the next twenty-eight years.

In 1947, Air Materiel Command modified the T-system, reducing the functions from five to three, to improve efficiency, reduce costs, and streamline operations. San Antonio Air Materiel Area instituted the resulting "Three Deputy" organization on July 27. Tested first at Oklahoma City and Mobile AMAs, the new structure consisted of Deputies for Administration, Supply, and Maintenance. The new Deputy for Administration combined the Deputies for Personnel (T-1) and Base Services (T-6), while the Deputy for Plans (T-5) became the Comptroller.

The concept called for the new deputies to operate to the greatest extent possible within the spheres of "pure" administration, supply, and maintenance, unencumbered by extra activities. Staff functions necessary to manage the base and the area, such as the Comptroller, Air Inspector, Public Information Office, and Technical Services Staff, reported directly to the deputy commanding general. Technical Services Staff, a new grouping of existing functions, consisted of technical advisors for the Army arms of service: Chemical, Ordnance, Signal, Transportation, and Quartermaster Corps; the Corps of Engineers; and the Finance and Medical Departments.

The "Three Deputy" organization was only in operation at Kelly Field for one month. On July 24, 1947, in preparation for "independence," Headquarters Air Force directed all its major commands to establish an "A-Staff" organization. Headquarters AMC told its AMAs not to reorganize at this time. San Antonio officers, knowing they would implement the "A-Staff" organization sooner or later, asked permission to put the new structure into effect quickly, which they received on August 5. On August 26, SAAMA, instituted the "A Staff."

In theory, under the "A-Staff" system, the chiefs of SAAMA's major offices held the various "A-Staff" positions as additional duties: the Chief of Personnel was appointed "A-1," Chief of the Airdrome served as "A-2," Chief of Maintenance acted as "A-3," and the Chief of Supply was "A-4." Independent staff offices reporting directly to the commanding general included the Comptroller, Air Inspector, Public Information Office, and Chief of the Hospital (formerly the Surgeon's Office). The new organization also removed the Judge Advocate, Adjutant General, and Chaplain from the Deputy for Administration and combined them with the Technical Services Staff to form the Technical and Administrative Services Staff. Like previous organizational systems, though, the "A-Staff" organization was short-lived.

By 1948, AMC had abandoned its earlier deputate organization in favor of directorates, which restored overall control of the command's policies and programs to the commander and allowed a needed degree of centralization. In turn, SAAMA adopted a two directorate system (Maintenance and Supply) on June 1, aimed at streamlining operations. The directorate system set up distinct lines between operational, administrative, and advisory functions. The reorganization eliminated the administrative staff offices as a separate group, combining this function with Personnel and the Judge Advocate, Adjutant General, Surgeon, and Chaplain, which lost their staff positions, to form the new Personnel and Administrative Office. Charged with physically running the base, the Base Executive assumed the functions of the Chief of the Airdrome. The Inspector General, Public Information Officer, and the new position of Comptroller served as the commander's personal staff. Basically, SAAMA kept this directorate system for the next forty-two years, adding and deleting directorates as needed.

Yes, Ma'am!

Bowing to the demands that women be allowed to serve their country, the Army organized the Women's Army Auxiliary Corps in May 1943. In less than four months, on September 1, the Women's Army Auxiliary Corps officially became a part of the United States Army and changed its name to the Women's Army Corps (WAC). Kelly's first WACs arrived less than a year after the auxiliary corps was first organized, led by Captain Rose E. Panowski, who reported to Kelly from Wright Field. Kelly's WAC detachment gradually grew until there were as many as 300 women in uniform. The detachment here was one of the first WAC squadrons in the Army Air Forces. In addition, Kelly Field had the first all-WAC weather station during the war. However, the WACs demobilized as fast as their male counterparts, and by 1946, only twenty WACs worked at Kelly. Their numbers dwindled gradually until only eleven remained. The last group of Kelly's WACs, Air Transport Command's flight traffic clerks, packed their B-4 bags and left the field early in June 1947. Although ATC's women-soldiers had only been at Kelly since 1946, they reminded the "oldtimers" of the WACs who brightened Kelly's scenery during the war.

LAST OF THE GIRLS IN KHAKI-Pretty Sgt. Bonnie Barron, one of the last WAC's to make their exit from Kelly Field, waves goodbye prior to boarding a C-54 enroute to her new station. Approximately 200 WAC's were stationed on Kelly at the height of the war. Today, the striking brunette sergeant is the last of a group of eleven enlisted WAC's shipping out to new stations.

Operation "CROSSROADS" called for the modification of B-17 bombers as remote controlled drones. These planes would fly in close proximity to atom bomb blasts gathering scientific data.

Supporting New Missions

While the Army Air Forces demobilized at breakneck speed, it faced certain realities which shaped its future: the reality of an independent Air Force, the division of Europe into two enemy camps, and the atomic bomb. While much of Kelly's energy was directed at the immense effort involved in dismantling the machinery of war, an increasingly large portion of the field's personnel began working on projects that reflected those post-war political realities. By late 1947, aircraft left Kelly's storage fields as fast as they entered as the Air Force outfitted new Air National Guard units with P-51s, sent AT-6s to Air Training Command for more pilot training, and filled out its forces to reach the goal of fifty-five groups by the end of the year.

Operation Crossroads

With the dropping of the atomic bombs on the Japanese cities of Hiroshima and Nagasaki, air power emerged as America's first line of defense and primary force of deterrence. But at this point, atomic power was largely an unknown force; knowledge had to be acquired--and fast.

On February 5, 1946, ATSC notified Kelly officials they would work on a project of national importance -- the modification of B-17 aircraft to participate in nuclear weapons testing in the Pacific. By the time the first B-17 arrived at Kelly on February 10, Maintenance officials already had devised a general plan of action. Work started immediately on the mock-up of the aircraft that would fly through the atomic bomb blast. The modified, radio-controlled B-17s were called "babies," while those that would control them were nicknamed "mothers."

Kelly's plan divided the sixteen B-17s into two groups: employees worked the six mother aircraft separately from the ten babies. Workers modified the mother ships to fly the babies by remote control, one baby ship to each mother B-17, with four other babies as replacements. The B-17 mothers soon bristled with antennas that sent out and received electronic "beeps." Transmitters sent out signals to fly the babies and control instruments on board. With television receivers, pilots and scientists in the mother ships could see what was happening in the area the babies flew over and could check instruments installed on special panels in the remote controlled B-17s to see

how they responded to instructions. Receivers also allowed pilots in the mother aircraft to keep track of their babies, flying over forty miles away. Kelly maintenance workers also devised an intricate interphone circuit to ease coordination between crew members on the mother ships.

Baby ships presented a whole different set of problems to Kelly's maintenance craftsmen. The B-17s had to remain standard enough to be flown normally by a regular crew and yet had to be able to take off, fly, and land without a crew. While aircraft had taken off and landed by remote control before, none had ever landed without a crew aboard. And these "babies" had to land undamaged. Workers installed small motors to operate brakes, throttles, and a special automatic pilot. Gears had to be raised and lowered, ignition cut off, and in-flight altitude controlled. Many miles of wire and terminal strips were used to fly these aircraft without a crew.

Maintenance workers installed the desired modifications from drawings, photographs, and instructions technicians from Wright Field, Ohio, brought with them. The intimate knowledge Kelly personnel had acquired after years of working on B-17s helped, too. They installed huge bags in the bomb bays to collect air samples, put in cameras to record conditions around and under the "babies," and installed geiger counters to register levels of atomic radiation. Wires, circuits, and other equipment were ground checked, and the aircraft were then test flown.

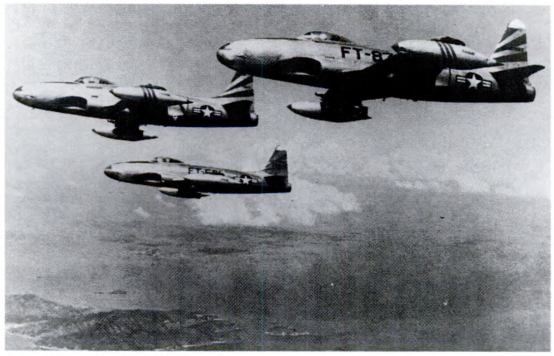

As the project neared completion, a fire occurred in the cockpit aboard one of the B-17s. A relocated windshield wiper circuit breaker rubbed against a hydraulic gauge line. The cockpit burst into flame, but workers extinguished the blaze before firemen arrived. Since no one wanted the burned plane to delay completion of the project, supervisors rolled up their sleeves and joined the workmen removing fire-damaged parts and wires. Taking parts off another B-17 in storage and working ten-to-twelve-hour days, workers finished the burned B-17 in time for this "baby" to join the others.

To show their appreciation for the hard work and long hours Kelly personnel had put in to complete the B-17s on time, Operation Crossroads project officers arranged for the workers to go on a demonstration flight in orange-and-black-banded mother and baby ships. The baby had a crew on board for safety reasons, but they kept "hands off" as it zoomed and circled around the field. On March 22, 1946, Kelly's last Crossroads aircraft left to train its crews. Everyone at Kelly cheered when they learned of the babies' and mothers' successful performances at the atomic bomb tests over Bikini Island.

P-80 Project

While German pilots flew jet aircraft in combat in 1944, the first American jet, the P-80 "Shooting Star," did not arrive at the tactical units until December 1945. While several different jet aircraft became operational between 1945 and 1948, they were still a rare breed to the workers at the San Antonio depot. Kelly was introduced to this new type of aircraft in March 1946 when its workers got the job to modify and change the engines on twenty-five P-80 "Shooting Stars" grounded at Love Field, Texas.

Since none of the Kelly workers had ever seen, much less worked on, a jet aircraft, this was indeed a test of their talents. A crew went up to Love Field and set up shop in a "borrowed" hangar from the former Lockheed Modification Center where they ran into several obstacles. Workers had to track down P-80 peculiar support equipment (things like mating cradles, engine slings, and engine stands) that were not available at either Kelly or Love Fields. While replacing J-33-11 turbojet engines with J-33-9 engines, crew members discovered the engines had fallen out of the mounts inside the crates during shipment. They had to photograph the engines to document the damage and write up reports on the faulty mounts. Once these

The first jet Kelly mechanics had a chance to work on was the Lockheed P-80.

things were taken care of and the damaged engines exchanged for good ones, workers installed elevator counter balance weights, replaced studs and hooks in the main landing gear door operating mechanism, relocated the engine fuel vent lines, and performed a fifty-hour inspection. The team completed, test flew, and delivered the twenty-five P-80s after only 245 manhours per aircraft. Kelly's first introduction to jet aircraft ended successfully.

The first jet aircraft, also a P-80, repaired at Kelly entered SAAMA's shops in June 1947. When it made a wheels-up landing at Biggs Field, Texas, a team from Kelly went to El Paso, took the jet apart, sent the engine to Wright Field in Ohio, and trucked the P-80 to Kelly where workers repaired the landing gear and fuselage and installed a later model J-33 engine. Colonel Frederick A. Bell, SAAMA's new Deputy for Maintenance, flight tested the jet on September 19, accurately predicting that the old reciprocating engines would soon disappear from Kelly's flight line.

Air Depot Training

In 1946, SAAMA picked up a mission that reminded depot old-timers of the war years. In April, Headquarters AMC notified Kelly that it would become the command's centralized training center for air depot groups and service teams. Headquarters AMA chose Kelly because of its centralized location, suitable climate for year-round training, and good air and rail connections. In addition, the south Texas base had adequate housing and training facilities readily available. The new program, scheduled to run between June 1946 and January 1947, would train approximately 12,000 men to supply and maintain aircraft, motor vehicles, and other pieces of Air Force equipment.

Most of these military personnel would man three newly-formed air depot groups: the 16th, 59th, and 86th. When fully manned, 1,676 personnel would be assigned to each air depot group. Other soldiers would form signal radio maintenance teams where they would learn to install, maintain, and repair airborne and ground radar and radio equipment for deployment around the world. Still others would receive training in salvage, corrosion control, and moisture-and-fungi-proofing operations. Kelly transferred men from the 4121st Army Air Force (AAF) Base Unit (Area Command), home for the base's military personnel, to the 4505th AAF Base Unit (Training) to train the air depot groups.

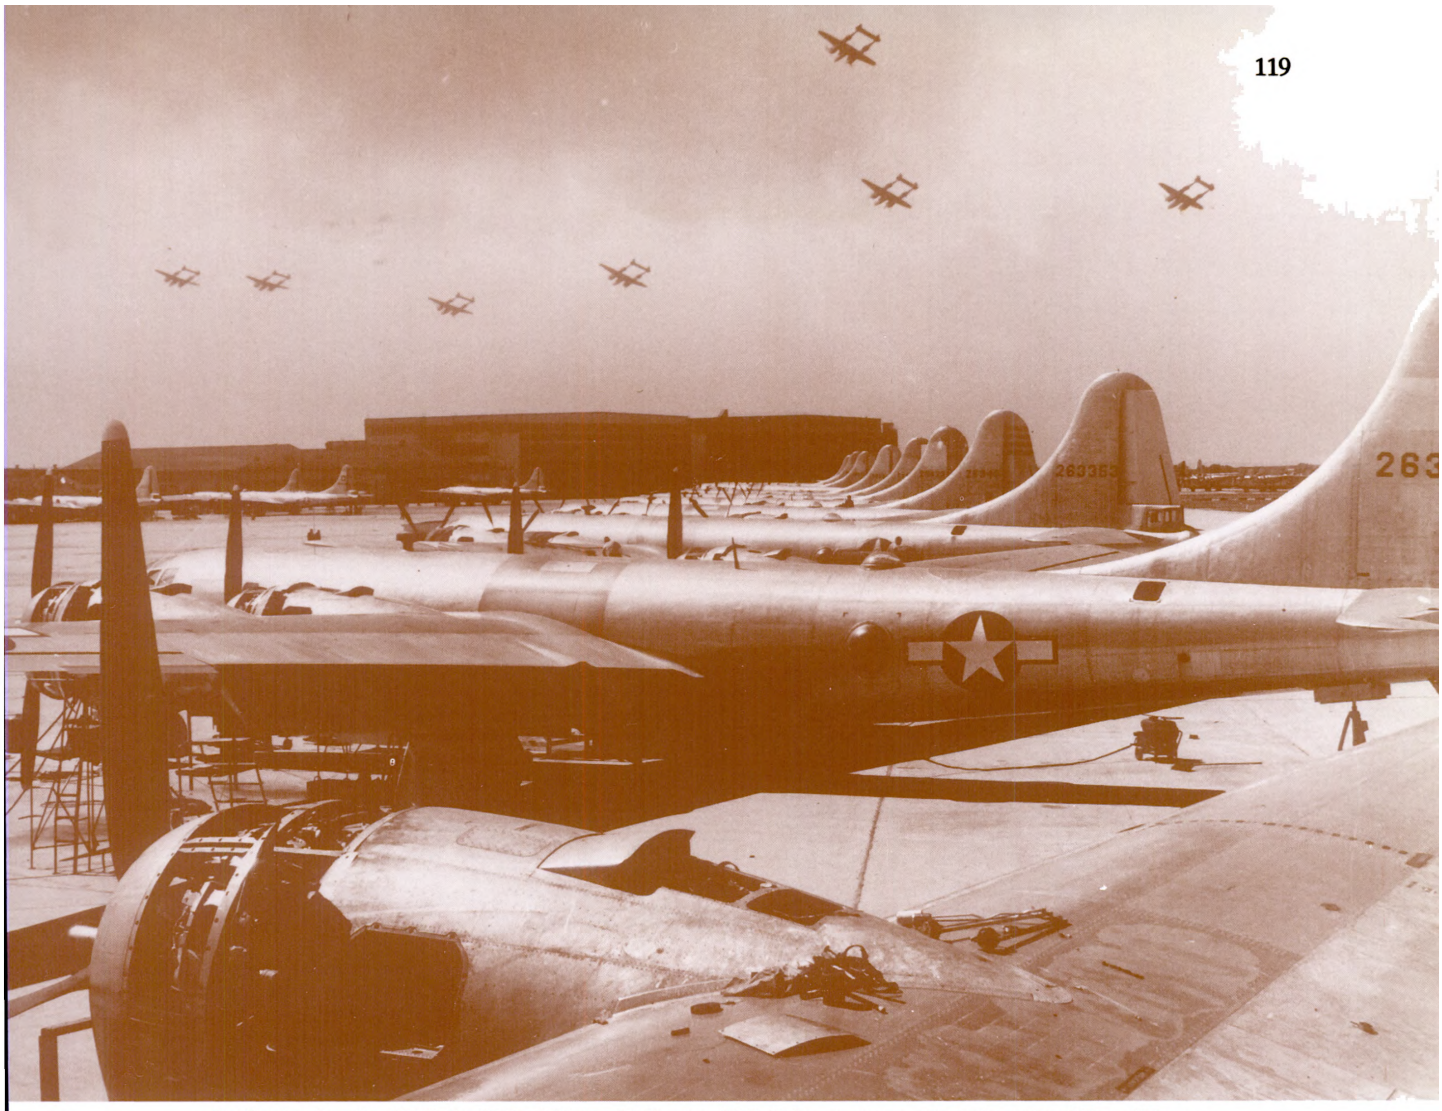

The 16th Air Depot Group transferred to SAAMA the first of May 1946. San Antonio AMA officials assigned personnel from the 16th to the 59th Air Depot Group since it had to be manned and ready for training by July 1. Fully trained, the 59th received its first mission in April 1947--putting the 1,500 P-51s and A-26s stored at Hobbs Army Airfield, New Mexico, in top condition to be flown out and then closing the air field.

With eighty percent of its personnel tuning engines and cleaning, repairing, and ground testing the aircraft, the 59th flew the last A-26 out of Hobbs the first week in November, five months ahead of schedule. With its mission at Hobbs complete, the 59th moved to Rome Air Depot, New York, on January 22, 1948. Hobbs Airfield transferred from SAAMA to the District Engineers on May 8th.

As the 59th moved to Hobbs in the spring of 1947, SAAMA was training the men of another air depot group, the 86th. Although its squadrons were only partially manned, the 86th moved to Rome Air Depot on September 19th for three months temporary duty. Completing its assignment one month ahead of time, the 86th returned to Kelly on December 7th.

Independence!

By the end of the war, it was a forgone conclusion that the Air Force would finally become independent; the main effort was creating a single, unified military department. All through 1946 work continued on what became the National Security Act of 1947, which provided for three military departments--the Army, the Navy, and the Air Force--and a united Department of Defense to coordinate national security matters. On September 18, 1947, W. Stuart Symington became the first Secretary of the Air Force. General Carl Spaatz, one of the first four pilots to land at Kelly in April 1917, was sworn in as the first Chief of Staff, United States Air Force, on September 26. The forty-year-old relationship with the U.S. Army ended, and a new era in which air power served as the nation's first line of defense began.

On September 18, 1947, the United States Air Force officially became a separate branch of the military.

In July 1947, facing fiscal reality that prevented the organization of seventy groups as they wished, Air Force leaders adopted a plan to organize and man fifty-five operational groups by Christmas. Of these fifty-five groups, nineteen would be bombers, twenty-eight fighters, and eight transport groups.

With independence, the tempo at Kelly quickened. On August 8th, SAAMA received orders to process aircraft, vehicles, aircraft accessories and other types of material for the 55 Group Program by December 20. In September and October, San Antonio Air Materiel Area added between 1,100 and 1,200 new employees to meet this December deadline. Kelly workers took 350 aircraft out of storage and prepared them for delivery: 286 P-51s, fifty B-29s, eleven L-5s, and three F-13s (the photo-reconnaissance version of the B-29).

In late November, the Air Force announced even more aircraft would be pulled from storage to flesh out the fifty-five groups; Kelly's storage fields were scheduled to lose fifty more B-29s and 300 fighters. In addition, Kellyites processed and repaired over 500 stored vehicles and 1,300 engines, and shipped twelve million pounds of equipment for the program. By working ten and twelve hours a day and weekends, SAAMA personnel met their deadline.

In 1948, Air Force installations dropped their Army titles and officially became Air Force Bases (AFB). On January 29, after thirty-one years as Kelly Field, the south Texas flying field became Kelly Air Force Base.

Support of Global Operations

The Berlin Airlift

After the end of World War II, relations between the former Allies quickly soured as Communists grabbed power in Eastern Europe. Completely encircled by the Russian Zone of occupied Germany, Berlin soon became a symbol of tremendous importance for both the East and the West. Attempting to drive American, British and French forces out of the city, the Russians placed restrictions on all rail, barge, and road traffic into the western sectors of Berlin, stopping it completely by June 22, 1948. West Berlin was isolated. The Allies had a choice: they could either withdraw all of their forces, abandoning Berlin to the Russians, or supply all the necessities of life for the military community and two million Germans by air. The Allies chose to stay and "fight." On June 26, the first flights of the airlift landed at Berlin's

Major General Clements McMullen

For over thirty years, the personal history of Clements McMullen and the public history of Kelly Air Force Base were intertwined. McMullen became a flying cadet in September 1917, earning his wings on March 6, 1918. Upon receiving his commission, he went to Kelly Field to enter the School for Instructors before moving on to Gerstner Field in Louisiana as a student in the pursuit course and instructor in combat flying. In July, he became the officer-in-charge of flying at the Gunnery School at Rockwell Field, California. After a year in California, Lieutenant McMullen joined the 90th Aero Squadron at Eagle Pass, Texas, for border patrol duty.

Between January 1921 and July 1922, McMullen served as the Assistant Engineering Officer at the Montgomery Intermediate Air Depot in Alabama and officer-in-charge of the Machine Shop and Motor Tests at Carlstrom Field, Florida. In July 1922, he took command of the 62nd Service Squadron at Brooks Field, Texas, before moving across the city to serve as Engineer Officer of the San Antonio Air Intermediate Depot at Kelly in September 1924. After spending two years in the Philippines (1926-1928), he returned to the States to attend the Air Corps Engineering School at Wright Field, Ohio. Upon graduation in June 1929, he was assigned to the Experimental Engineering Section there at Wright Field.

In September 1933, Captain McMullen entered the Air Corps Tactical School at Maxwell Field, Alabama. He remained at Maxwell after graduation, and it was during this time that McMullen became one of the founding members of the Order of the Daedalians, a group of American World War I pilots dedicated to ensuring that the United States would always be first in air and space. From Maxwell, McMullen went to Langley Field, Virginia, to work at the General Headquarters, Air Force. In August 1937, Major McMullen entered Command and General Staff School in Kansas and, upon graduation, went to Duncan Field as the Engineering Officer of the San Antonio Air Depot and then commander of the depot.

He remained at Duncan Field until January 1942, when he took command of the 3rd Air Service Area Command in Atlanta, Georgia. After serving in Washington, D.C. for two years and entering the ranks of general officers, now-Major General McMullen went overseas to take command of the Far Eastern Air Service Command in September 1944. After the war, he served as Chief of Staff of the Pacific Air Command. In November 1946, he assumed command of the newly reactivated Eighth Air Force at Fort Worth, Texas.

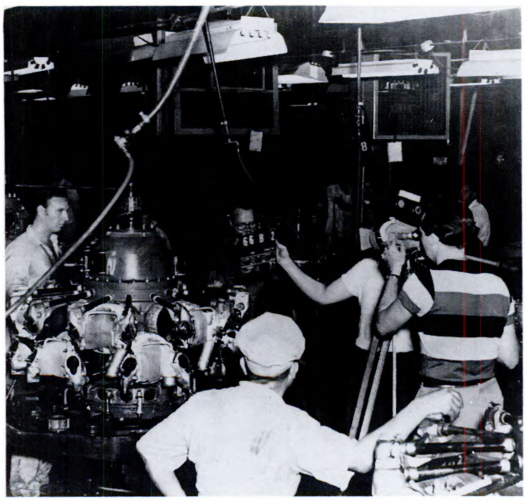

General McMullen received a new assignment in January 1947 as Deputy Commanding General of Strategic Air Command, a position he held until October 1948 when he, once again, returned to Kelly as Commander of the San Antonio Air Materiel Area. General McMullen commanded Kelly and SAAMA until February 28, 1953, when he retired after 36 years of dedicated service.

Tempelhof Air Base with eighty tons of milk, flour, and medicine. Kelly's first shipment of supplies for the airlift left on June 30. Operation Vittles was on.

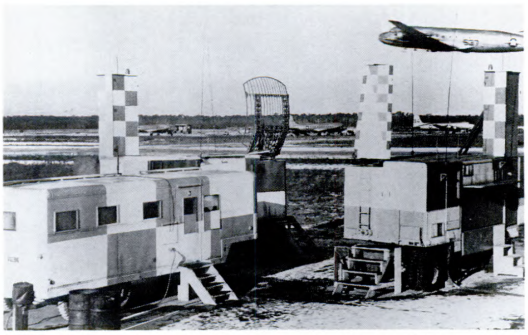

Thousands of flights into Berlin followed, with aircraft landing or taking off at three minute intervals, twenty-four hours a day, in all types of weather. The prime workhorse of the Berlin Airlift was the C-54 "Skymaster." Of the 400 C-54s in active service, 319 flew in the airlift. With its 14,000-pound cargo capacity and four R2000 reciprocating engines, the C-54 ferried ton after ton of food, coal, and other supplies to the beleaguered city.

Kelly Air Force Base played a key role during the Berlin Airlift, supplying over 15,000 items of equipment, ranging from radio sets to all types of ground vehicles (such as refueling trailers, fire trucks, and cranes), and from tiny nuts to whole fuselage sets. Kelly was the only depot in the nation turning out R2000 and R4360 replacement engines, the powerplants used by the aircraft flying the airlift. By December 31, the Supply Division had shipped 1,317 R2000 engines worth $19 million and thirty-four R-4360 engines worth $1.7 million for the airlift.

Requirements for Operation Vittles increased the level of activity in the Directorate of Maintenance to its highest level since World War II as Kellyites worked to provide a steady stream of replacement engines for Europe. Production schedules increased,

Hollywood came to Kelly when film crews visited the San Antonio Air Materiel Area engine shops to film R2000 engines being overhauled for Operation Vittles.

A C-54 aircraft passes over the mobile ground control radar as the aircraft takes off from Rhein-Main Air Base, West Germany, on its way to Berlin.

overtime was used extensively, and second and third-shift operations were initiated as needed. Headquarters AMC authorized Kelly to hire more than 400 new workers, the bulk of whom went to the Engine Repair Section. Other sections "loaned" employees to work on the engines. More than 1,800 technicians, working in two eight-hour shifts, turned out R2000 and R4360 engines. Kelly's engine production more than doubled. By June 1949, engines valued at $50 million had left SAAMA shops.

But Kelly workers turned out other things for Operation Vittles as well. Mechanics rushed work on twenty-five C-54s by November, preparing them for flying conditions in Germany during the winter months. Spark plug production increased from 350 a day in July to 14,000 a day eleven months later. The Air Force's only chrome-plating plant and rubber plant were in operation around the clock. Kelly shipped out an additional $7 million worth of material for the aircraft flying the airlift.

By May 1949, the Soviets realized they had underestimated the Allies' ability and resolve to defend West Berlin. Their blockade ended May 12th, although the Allies continued flying in supplies until September 30 when reserve stocks in Berlin reached satisfactory levels and the international situation clarified. In fifteen months, Operation Vittles delivered over 2.3 million tons of food, fuel, and supplies to Berlin, proving beyond a shadow of a doubt that anything within reason could be moved by air anywhere in the world. Without a doubt, Operation Vittles was a victory for the Allies in the Cold War.

Kelly Integrates

On July 26, 1948, President Harry S. Truman signed Executive Order 9981, directing the armed services to foster equal opportunity. This was the catalyst the Air Force needed to desegregate. All Air Force leaders agreed segregation was inefficient. As General Carl Spaatz, Air Force Chief of Staff, wrote in April 1948, "It is the feeling of this Headquarters that the ultimate Air Force objective must be to eliminate segregation among its personnel by the unrestricted use of Negro personnel in free competition for any duty within the Air Force for which they may qualify."

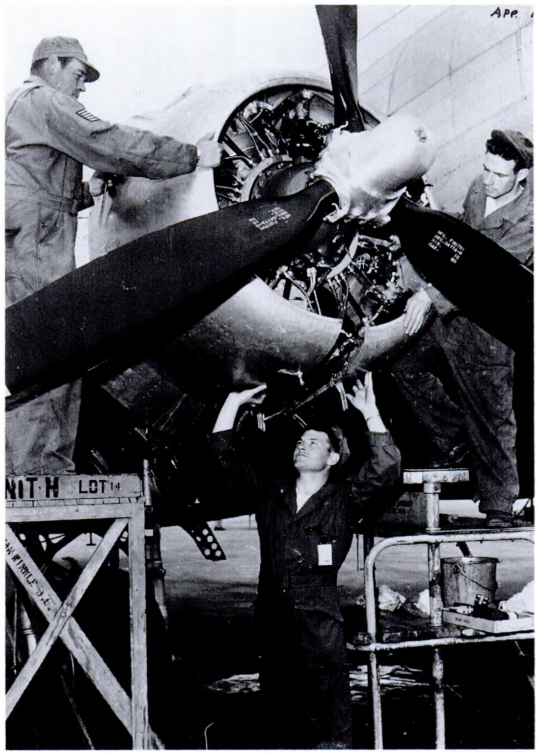

Kelly's 341 enlisted black airmen had been assigned to the all-black 3050th Air Base Support Squadron. With desegregation the official Air Force policy, Kelly's military leaders began integrating blacks into all-white squadrons during the summer of 1949. During July, officials interviewed the black airmen in preparation to reassign them to other units. Over 200 of Kelly's blacks were sent to other bases with vacancies in their specialities. All remaining black personnel were assigned to Headquarters and Headquarters Squadron SAAMA, starting with three men in August and followed by another 107 on September 25. With integration of black airmen complete, AMC discontinued the 3050th Air Base Support Squadron on October 5, 1949.

Despite fears to the contrary, no major indication of racial friction appeared at Kelly after the integration policy went into effect. When blacks first moved into the "Palace" (airmen's living quarters), military officials placed the blacks in separate sleeping rooms. Gradually, officers moved blacks into white areas and whites into black areas. Change was made slowly, with gradual contact and adjustment for both races. When any problems occurred, the commanding officer took a firm position, supporting the integration policy. A few potential cases of insubordination to black noncommissioned officers arose, but officers put a stop to these immediately. Although most were skeptical that integration would work, Kelly's efforts in 1949 showed that blacks and whites could live and work together.

The Korean War

By the summer of 1949, activities at Kelly were beginning to settle back to their pre-airlift tempo. The Engine Repair Section, which had been operating with 1,800 workers and two shifts, went back to one eight-hour shift and released its extra personnel. Top priority went to the R4360 engine as more B-36s entered the Air Force's active inventory. Managers suspended overhaul of R2000 engines, which had been a top priority since 1946. The huge XC-99, the largest aircraft in the free world, thrilled San Antonians as it flew in and out of Kelly. Life was returning to normal in south Texas.

But halfway across the world, tensions were increasing. During the predawn hours of June 25, 1950, North Korean soldiers attacked across the thirty-eighth parallel, the line which divided the communist North from the democratic South, in an act of raw aggression. On the afternoon of June 25 (June 26 in Korea), the United Nations (UN) Security Council called on the North Koreans to withdraw to the thirty-eighth parallel. The North Koreans responded by intensifying their attack. During the evening of June 26, President Truman directed General Douglas MacArthur, Commander of the Far East Command, to use the American military to support the South Korean army. The next day, the UN Security Council called for the members to assist the

With the coming of war in Korea, C-47s previously placed in "mothballs" were pulled out of storage, reconditioned, and put back on active duty.

Republic of Korea to repel the attack and restore peace and security to the area. On June 30, Truman authorized air attacks against North Korea and the use of American ground forces to stop the attack.

Military installations across America responded quickly to the fast-moving war in a land many Americans had never heard of. On June 28, Headquarters AMC initiated Project Hold-Off, authorizing the highest priority for shipment of items to the Far East. Supply personnel, working two shifts seven days a week, processed and shipped requests destined for the Far East Air Forces within twenty-four hours of their receipt. Kelly Supply employees processed 63,263 line items in August alone, fifty to sixty percent of AMC's Project Hold-Off work load.

Just before the 4th of July holiday, Air Materiel Command notified SAAMA its Maintenance shops had to prepare twenty-two B-26 "Invaders" for combat. Summer vacations were forgotten. The first B-26 arrived at Kelly on July 4; the last left on schedule on July 9. To meet this tight deadline, SAAMA mechanics worked around-the-clock. As American airmen rushed to the Korean peninsula, depot workers pulled thousands of aircraft out of storage.

Major General Clements McMullen welcoming back Mrs. Gertrude Threadgill, the first of the women war workers of World War II, known as "Kelly Katies," who returned to the old job she held from 1941 to 1945, that of an aircraft parts patternmaker.

All-Out Mobilization, All-Out Sacrifice

To All SAAMA Personnel:

These are troubled times. The next few months will be a very vital period in American history; they may well determine whether we live as free men and women or as slaves.

To maintain our freedom, American industry, military and civilian, has been ordered to mobilize its forces for peace. This will mean longer working hours, harder work, and ever-increasing sacrifices on the part of all Americans.

As part of American industry, Kelly AFB has a key spot in this mobilization. Our work loads and production quotas will increase. Even now many of us are working long hours six days a week to rush vital projects to quick completion. In the near future more and more of us may be called upon to work longer hours, to help step up production. Such a program will naturally necessitate sacrifices on the part of all of us. These sacrifices are the privilege of only a democratic people.

In short, we are now confronted with our biggest job since the end of World War II. We must do our work faster and more efficiently if America is to be prepared to defend its freedom--our freedom.

God grant that we may do this job with the same determination and courage as that being displayed by American youngsters on the battlefields of Korea.

Clements McMullen
Major General, USAF
Commanding

The B-29 outdoor production area, known as the "Great White Way," allowed for around-the-clock maintenance of the big aircraft.

On July 1, 1950, 2,029 planes, mainly AT-6s and F-51s, rested between Kelly's runways. Six months later, only 1,389 aircraft remained; all but thirty-nine F-51s were on their way to operational forces. Kelly's personnel rolls swelled; the number of workers in the Maintenance Division jumped from 6,620 to 8,011 by December 1950.

Production schedules increased. Maintenance employees worked around-the-clock once again. Between June and November 1950, these workers put in a total of 1.1 million manhours to meet the increased demand for aircraft, equipment, and accessories. In the Engine Repair Section, an urgent need existed to increase production of the giant engines for the B-36. The requirement for vehicles and powered ground equipment was just as great. Kelly's maintenance shops were in high gear.

As in the closing days of World War II, the B-29 was in great demand to bomb targets deep within North Korea. To bring Strategic Air Command's bombardment groups to full strength, B-29s came out of storage. During the day, aircraft mechanics overhauled B-29s under huge umbrellas to help block out the searing summer sun. During the night, electricians rigged special outdoor lighting to illuminate the planes lining both sides of the ramp. Reflector lamps on drop cords were arranged so one hung over each engine of the plane being repaired. The B-29 production line next to building 324 earned the nickname "The Great White Way" as the reflected glow of lights shining on the aluminum skin of the bombers lit up the evening sky.

For two months mechanics worked on "The Great White Way," which earned a great deal of national publicity, but a better method was needed. To improve efficiency and put everyone on one shift, Maintenance officials replaced it with an improved production line that operated under the principle of bringing the work to the mechanic rather than moving the mechanic to the work. The huge thirty-two work station aircraft overhaul line extended for more than a mile. It could handle any aircraft in the Air Force inventory except the mammoth B-36. To make the line adaptable to different sized aircraft and keep the work flowing smoothly, workers processed large planes like the B-29 in single file. Smaller ones like the AT-6 and F-51 went through

the overhaul line in pairs. A radio telephone system and loud speakers were installed so personnel could communicate between work stations. Four parts trains, dubbed the "Maintenance Express," delivered supplies and parts eight times a day to fifty different places along the overhaul line.

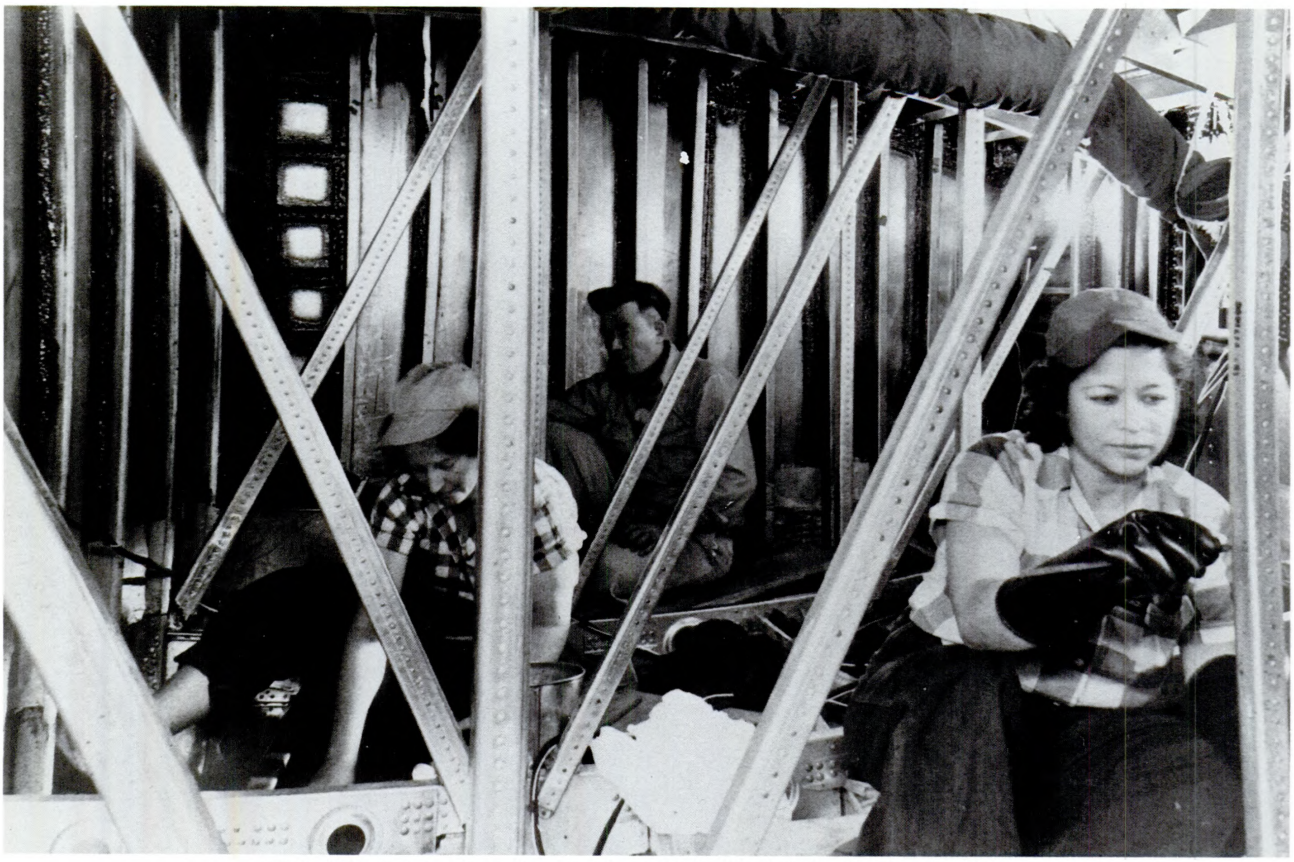

Two-Zone Support System

Organizationally, AMC and its depots were better prepared than they were for the start of World War II. In 1948, in an effort to streamline storage and distribution procedures, AMC eliminated the specialized depots and area depots that served a number of bases within a small geographic area. In their place, the command divided its responsibilities into two zones: the eastern zone served Europe and those bases east of the Mississippi River while the western zone served the Pacific and bases west of the Mississippi. Each zone had depots for the supply and maintenance of each property class. Material flowed from the manufacturer direct to the appropriate zonal depot. Prior to the two zone--or bi-zonal--system, SAAMA maintained approximately 165 property classes and sub classes. With the two zone system, its workers specialized in fifty-four property classes. Obviously, as work load in some maintenance sections grew, it shrank in others; for example, Kelly managers expected an increase in instrument work, but a substantial decrease in landing gear and sheet metal work.

By December 1950, it was clear to everyone that the police action in Korea would not end soon. On December 16, President Truman declared a state of national emergency. Headquarters AMC gave the AMAs authority to institute a forty-eight hour work week when the work load required it. Thousands of men were drafted or recalled to active duty. Kelly lost 720 civilians to the Armed Forces between January and June 1951; however, SAAMA gained 5,313 civilian authorizations during the same six-month period. New hiring during this time frame was the most rapid build up in strength since the first part of 1942, shortly after the outbreak of World War II.

Under the "Two-Zone" support system, San Antonio Air Materiel Area assumed responsibility for the B-36 "Peacemaker," the nation's first truly global deterrent force.

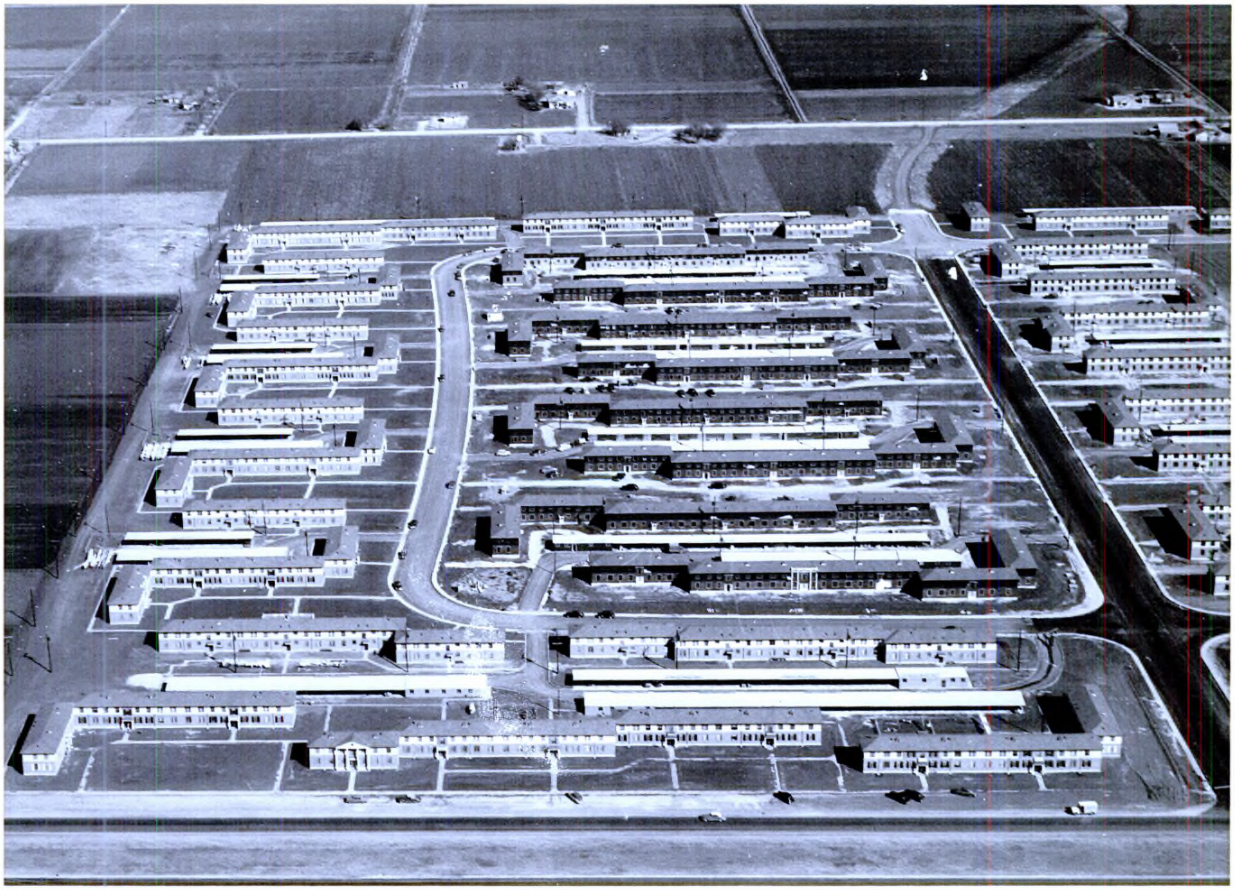

"Kelly Katies" doing desealing work in a B-36 fuel tank during the Korean War.

Many of the "new" workers hired were "Kelly Katies," who returned to the lathes and welding masks they left at the end of World War II. On June 30, 1950, only 1,573 women worked at Kelly; a year later, 3,297 women were on the base's payrolls. Seven hundred of them worked in Maintenance. As an article in the base newspaper, The Flying Times, rhapsodized, "And this time, Katie doesn't have to prove herself. She was one of almost 10,000 gals who kept planes and material rolling out of the nation's biggest air depot in [World] War II."

With all of these new employees, Kelly had to start a massive training program. Most training started within the organizations themselves as experienced workers taught the new employees their jobs. The "old timers" generally started the newcomers on simple jobs on the production line, before moving on to more complex jobs that required extensive classroom training. Two hundred and forty-four existing workers went into Kelly's Apprentice Training Program after the Korean War started to meet the increased demand for skilled craftsmen. These indentured apprentices trained in ten different trades, such as aircraft radio and radar technician, aircraft engine mechanic, aircraft electrician, and aircraft service mechanic.

For over three years, Kellyites overhauled aircraft and engines and shipped supplies halfway around the world to support the air forces in Korea. In addition to the war work, SAAMA gained new responsibilities as the headquarters decentralized. Its personnel strength peaked in December 1952 when 23,463 employees reported to work daily, more than at the height of World War II.

While the police action in Korea officially ended on July 27, 1953, American forces did not draw down as fast as they had after previous wars. Americans relearned the old lesson that the price of peace is eternal vigilance. The Cold War was far from over.

Billy Mitchell Village

Early in 1949, the Southwest Construction Company, backed by a New York insurance company, announced plans to build military family housing for Kelly and Lackland Air Force Base personnel on an eighty-six acre tract of land at the corner of Lackland and Frio City Roads. This four million dollar project followed the Air Force policy of encouraging private capital to build military housing in areas where housing was in short supply. Faced with a serious housing shortage for its enlisted personnel, Kelly officials enthusiastically supported the project. Since the area was still outside San Antonio's city limits, the Air Force agreed to provide some essential services to the project such as water, sanitary sewage, and raw sewage lines. By June, the Federal Housing Administration had approved construction of 408 one-to-three bedroom brick apartments. The construction company also planned to build a two-acre community center for the model "town." Officials of Kelly, Lackland, San Antonio, and the Billy Mitchell Corporation attended groundbreaking ceremonies at Kelly's front gate on August 2, 1949.

In November, Kelly learned the Air Force approved construction of an additional 592 units under the Wherry Housing Act, bringing the total up to 1,000 new apartments and making Billy Mitchell Village the largest military family housing unit in the nation. Rental rates for the new apartments were very reasonable. Airmen paid $52.50 a month for a one bedroom apartment, $65.00 for two bedrooms, and $72.00 for a three bedroom apartment. Rates for officers were slightly higher ($65.00, $80.00, and $90.00, respectively).

On December 16, Assistant Secretary of the Air Force Eugene M. Zuckert and other Air Force and city dignitaries attended dedication ceremonies for Billy Mitchell Village. Although Assistant Secretary Zuckert cut the ribbon, officially opening the Village to the public at this time, the apartments weren't available for rent until July 1950, and Kelly and Lackland people quickly moved in.

While Billy Mitchell Village housed Kelly military families, the base didn't own the complex. This changed on March 1, 1960, when, under provisions of the Wherry Housing Act of 1959, Kelly acquired 592 units in Billy Mitchell Village. At the time, base officials had neither the money nor the inclination to buy the remaining units when offerred.

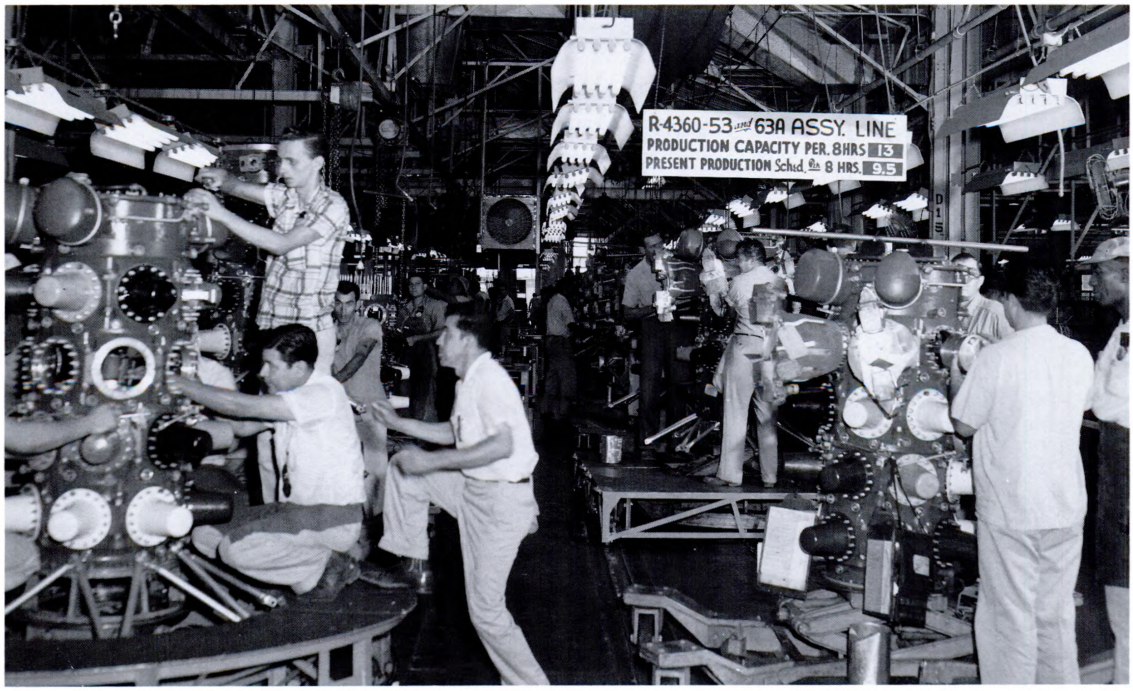

The Big Show

The B-36 Mission at Kelly

Faced with a war on opposite sides of the world, the United States Army Air Forces ordered a long range, heavy bomber from Consolidated-Vultee in 1941. Development of the B-36 was slow, however; the new bomber did not make its maiden flight until August 1946. Nicknamed the "Peacemaker" because of its deterrent effect, the B-36 could deliver nuclear weapons to any place in the world. Its six 3,000-horsepower R4360 engines "pushed" the giant bomber at a maximum speed of 410 miles per hour.

Kelly's first association with the B-36 came through the Pratt and Whitney R4360 engines. Named as the only maintenance depot for these huge powerplants, SAAMA managers began planning for the new work load late in 1946. While the first R4360 did not roll off Kelly's engine overhaul line until August 1948, the intervening years were not wasted. Workers spent the time projecting how many spare parts (like carburetors, magnetos, and wiring harnesses) would be needed; constructing build-up stands; retooling; and putting test facilities in order. This grace period facilitated a smooth transition from overhauling smaller engines to the most powerful engine of its time.

The first B-36 aircraft repaired at Kelly arrived on August 30, 1948, from Carswell AFB near Fort Worth, Texas. While workers fixed damaged bomb bay doors and made other repairs, they took the opportunity to study the bomber at close range. Knowledge gained from this visit was put to good use; in September 1949, SAAMA joined Oklahoma City AMA as a specialized repair depot for the B-36, marking Kelly's entry into the big airplane overhaul business. By 1951, B-36 "Peacekeepers" had been arriving at Kelly in ever increasing numbers. In June, SAAMA "swapped" its responsibilities for the B-47 "Stratojet" to Oklahoma City AMA for all the B-36 work load in the western bi-zonal area. Since Kelly already overhauled all R4360 engines and served as the B-36 propeller repair point, it made sense for SAAMA to assume full maintenance responsibility for the aircraft. In January 1952, Aircraft Repair Branch workers stopped overhauling all other aircraft, concentrating totally on the B-36. Work on the "Peacemaker" moved to the now famous Kelly production line in back of building 324.

Production of the R4360 engine would be Kelly's largest engine work load until the arrival of the F-100 jet engine in the mid '70s.

In the spring of 1952, Headquarters AMC instituted a massive decentralization program (to be discussed later in this chapter), delegating worldwide responsibility for assigned classes to the prime depots. San Antonio AMA assumed complete responsibility for the property classes dealing with Convair aircraft -- the B-36 and XC-99. In addition, Kelly workers became responsible for all major repair work for crash-damaged B-36s, including going to the crash site and preparing the giant bomber for a one time flight to Kelly for major repair.

Project SAM-SAC

As prime depot with complete responsibility for the B-36, SAAMA began managing various modification programs for Strategic Air Command's (SAC) first line bomber. One of these was Project SAM-SAC, or specialized aircraft maintenance for the Strategic Air Command. This huge modification program called for the modernization and standardization of the B-36 fleet over the course of six years. Although employees at Consolidated-Vultee Aircraft Corporation at Fort Worth, Texas, performed the actual work, SAAMA workers managed the program. It was the first time in Air Force history an air depot controlled a program of this size and scope. In March 1953, C. S. Dougherty, civilian chief of SAAMA's Command Work Load and Control Office, signed the initial $15 million contract, believed to be the largest contract ever signed by the San Antonio depot up to that time. Work on the first B-36 began on April 1, 1953; SAC accepted it on 30 July.

Because the project was so large, SAAMA managers broke it into phases or cycles (in the parlance of the day). Cycle I encompassed the progressive disassembly, inspection, and repair of the B/RB-36 fleet. Consolidated-Vultee workers reconditioned the tail section and wings, including the engine nacelles and jet pods. A total of 361 B-36s went through Cycle I by its end in February 1957. Cycle II, which ran from April 1955 to April 1957, completed the modification project. Only 146 of the propeller-pushed bombers went through Cycle II because of the accelerated phase out of the B-36. Air Force leaders decided only those B-36s scheduled to remain in the tactical inventory for at least one year would be modified and repaired. Total costs for Project SAM-SAC reached $156 million.

B-36 Maintenance Stands

A problem arose early in 1955 concerning B-36s that had been used in atomic tests in the Pacific. The induction of these radioactive contaminated aircraft into the Fort Worth plant naturally concerned Convair officials (Consolidated-Vultee Aircraft Corporation became Convair, a division of General Dynamics, in 1954). While no one knew these aircraft were contaminated beyond safe handling levels before they arrived at the plant, SAAMA managers quickly initiated a decontamination program. Convair mechanics used special handling techniques and took precautions, which not only disrupted the smooth operation of the work being done, but also increased the flow time for the affected aircraft. Workers removed the contaminated R4360 engines and shipped them to Kelly, where workers placed them in isolated storage until they could be decontaminated.

In March 1956, Headquarters SAC published a regulation requiring its bomb wings to monitor radiation levels of all B-36s before flying them to Fort Worth for the SAM-SAC modifications. Despite these precautions, some contaminated aircraft still arrived at the Fort Worth plant. Kelly's decontamination project lasted for the remainder of Project SAM-SAC.

Memo From The Boss

MAINTENANCE ENGINEERING DIRECTORATE
SAN ANTONIO AIR MATERIEL AREA
KELLY AIR FORCE BASE, TEXAS

16 April 1952

Hello folks -

Many years ago when I was a stinking little jerk, I heard one of the old professors say, "You can do anything you think you can." These words I heard; they meant nothing to me at the time. I have since learned that the words are completely true. Our B-36 production is an example.

The B-36 is a very large piece of machinery and all of its gadgets are very complicated. Yet the Aircraft Repair Division has pitched into the problem and B-36's are rolling out at the rate of one every other day. They are on schedule, the workmanship is much improved, and less man-hours have been spent on them than before. Here is a living fulfillment of our triple-threat ambition to get our work out when promised, to do better work, and to save on the cost. All three of these purposes are important.

The Aircraft Repair Division under the firm, just leadership of Ed Nevels has made good on all three of these counts, when the opposite might have been expected. All other divisions have done their parts too. But the fellows in Aircraft Repair believed they could do this job better than it had ever been done before. Because they believed they could, they did. I admire their courage and the results they get.

James L. Jackson
Colonel, USAF, Director

B-36 power packs allowing for Quick Engine Change capability saved both time and money.

Quick Engine Change Program

One of the more important things SAAMA learned from its experience in managing the B-36 and its engine was the idea of the Quick Engine Change (QEC), the build up of engines with accessories into a powerpack that could be installed on an aircraft in the field in a minimum amount of time. The QEC concept cut the costly and time-consuming practice of preparing and then storing an overhauled engine. While Kelly Aircraft Division workers had been doing this on a limited scale for base support aircraft since 1951, SAC expressed an interest in the program for its B-36s. In March 1953, SAC and AMC established a tentative production schedule of twenty-five powerpacks in April.

Mechanics began working in building 310 until the new facility, building 4001 on East Kelly, was ready in April 1954. Once set up in the building on East Kelly, workers cut the time necessary to produce a B-36 powerpack from 2,035 manhours in October 1953 to 831 manhours in May 1954. On July 14, 1954, Equipment Division employees overhauled their 1000th B-36 powerpack.

As the phase-out program for the B-36s progressed, Kelly began phasing down the B-36 QEC program, too. Mechanics completed work on the last B-36 QEC on August 27, 1957. Between April 1953 and August 1957, workers overhauled a grand total of 4,265 B-36 powerpacks in SAAMA shops. But the program did not die; as work on the B-36 QEC wound down, workers increased overhauling powerpacks for other aircraft, including the B-47 and F-102.

Phase out of the B-36

In 1953, the Air Force decided to phase out the B-36 as quickly as its replacement, the jet-powered B-52, could be phased in. On August 14, 1954, Convair delivered its last B-36, "the most important bomber that never went to war." With it came the last R4360 engine. Although production of the last piston-driven bomber ended, SAAMA's involvement continued for the next five years, and Kelly's responsibility continued for another ten.

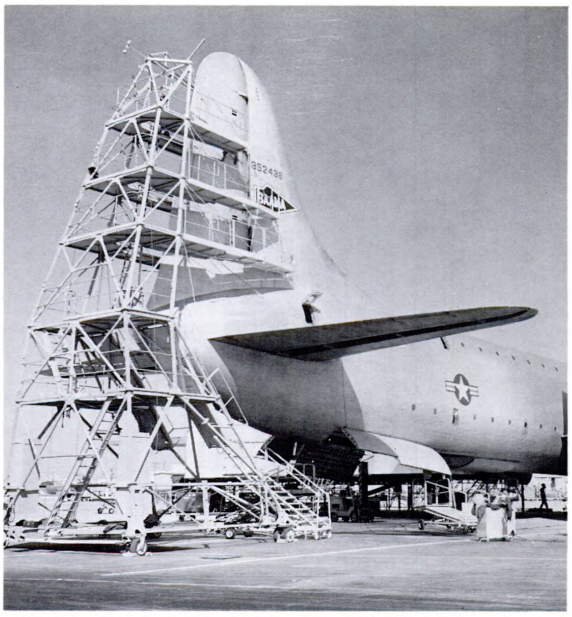

The B-36 phase out was a learning experience for everyone; it was the first time the Air Force had ever phased out a first-line weapon system. Handling the program required finesse as the B-36 continued to be the nation's front line strategic bomber. It would remain as the cornerstone of American national security policy until the B-52 or B-58 could be produced in sufficient quantities to assume the nuclear deterrence role. As lead air materiel area, SAAMA had to ensure those B-36s remaining in SAC's fleet stayed operationally ready, while managing the phase out program at the same time.

Air Force officials initially scheduled the B-36 phase out over a five-year period, beginning in 1956. The AMC plan designated its facility at Davis-Monthan AFB as the storage, reclamation, and salvage site. The 3040th Aircraft Storage Squadron received and stored the B-36s until a contractor demilitarized and then salvaged them.

The first B-36 to be phased out arrived at Davis-Monthan AFB on February 7, 1956; by the end of June, twenty-nine of the huge bombers had arrived. Timing became a critical factor, since the storage area only held eighty or so B-36s at one time. With an increasing number arriving each month, it was imperative that a contractor begin the reclamation and

salvage effort. Air Materiel Command awarded the contract on June 30 to the Mar-Pak Corporation of Painesville, Ohio, which began reclamation work on the first B-36 on September 13, 1956.

The B-36 phase out went much faster than originally anticipated. On February 18, 1959, Mar-Pak employees began work on the final B-36, the last piston-engined heavy bomber to serve in the Air Force. A total of 339 "Peacekeepers" were demilitarized and their hulls salvaged in just three years, ending another era of SAAMA and Air Force history. As the jet-powered B-52 and B-58 replaced the B-36, Kelly and its workers entered the jet age.

Maintenance on the XC-99's vertical stabilizer was accomplished on a workstand as tall as a five-story building.

Saga of the XC-99

Just as Air Force officials realized they needed a long range bomber at the start of World War II, they also saw the advantages of a long range cargo transport. While development of the bomber received top priority during the war, events after the war, like the Berlin Airlift, brought home the need for larger transports. In 1947, Consolidated-Vultee workers converted one of their B-36s into the XC-99 cargo transport, the world's largest prop-driven carrier. Only one XC-99 was ever built.

Able to carry 400 troops, 305 stretchers, or 101,000 pounds of freight, the XC-99 attracted attention wherever it flew. Six Pratt and Whitney R4360 Wasp engines powered the XC-99 at a top speed of 300 miles per hour. Wing span of the giant ship was 230 feet, the same as that of the B-36; but the fuselage was 182.5 feet long, nineteen and a half feet longer than its sister ship. Topping off at fifty-seven and a half feet, the vertical fin was as tall as a five-story building. The fuselage of the XC-99 provided 16,000 cubic feet of usable cargo space, the equivalent of three standard freight cars. Fuel capacity of the plane was 21,116 gallons, and the XC-99 could fly more than 8,000

Special workstands had to be constructed for maintenance of the XC-99's six engines. Notice that the tail of the plane is so high that it had to remain outside the hangar.

miles without refueling. Each of its six engines required 190 gallons of lubricating oil.

Many parts of the giant cargo plane were interchangeable with the B-36, and workers used B-36 technical orders to keep the XC-99 operational. However, its control surfaces were not interchangeable with the B-36, requiring special manufacture when replacements were needed. This made repair of the plane costly and occasionally prevented it from keeping to a tight cargo delivery schedule.

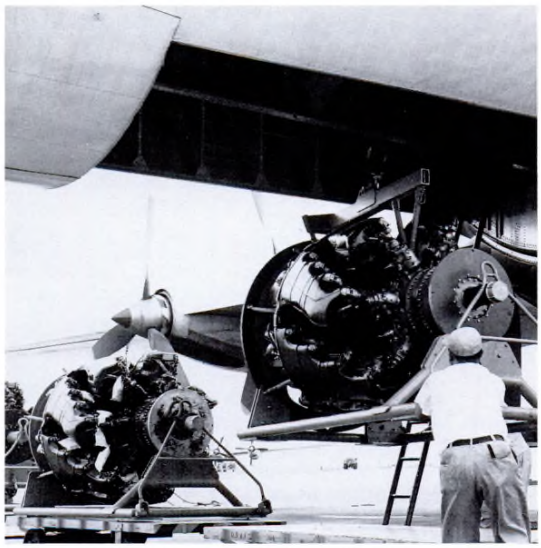

Pilots and crews of the XC-99 were extravagant in their praise of the plane's performance. While they considered the first fifty feet in take off as critical, pilots reported the plane handled easily once airborne. The XC-99 could land on any paved, 5,000-foot long runway that had a minimum weight capacity of 14,000 pounds. By reversing its props, the XC-99 could back nicely into flight line loading zones before taking off with 60 to 100 percent more cargo than contemporary military transport aircraft.

The XC-99 was so closely associated with Kelly that few remember Consolidated originally built the plane for SAC. Between May 26, 1949, when the Air Force accepted it, and September 8, 1950, when it was reassigned to Kelly, the XC-99's home was with the 7th Bombardment Wing at Carswell AFB, Texas. The XC-99 first landed at Kelly on June 13, 1949, and went into the Maintenance shops the next day for work on the propellers. It returned to Kelly on June 27 after a trip to California for modification and installation of more powerful versions of the R4360 engine. Thus began Kelly's affair with the huge transport.

The XC-99's first cargo flight to Kelly was made on July 14, 1950, with Colonel Frederick Bell, SAAMA's Maintenance Director, as pilot. This

Originally assigned to the Strategic Air Command at Carswell AFB, Texas, the XC-99 ultimately made its home at Kelly.

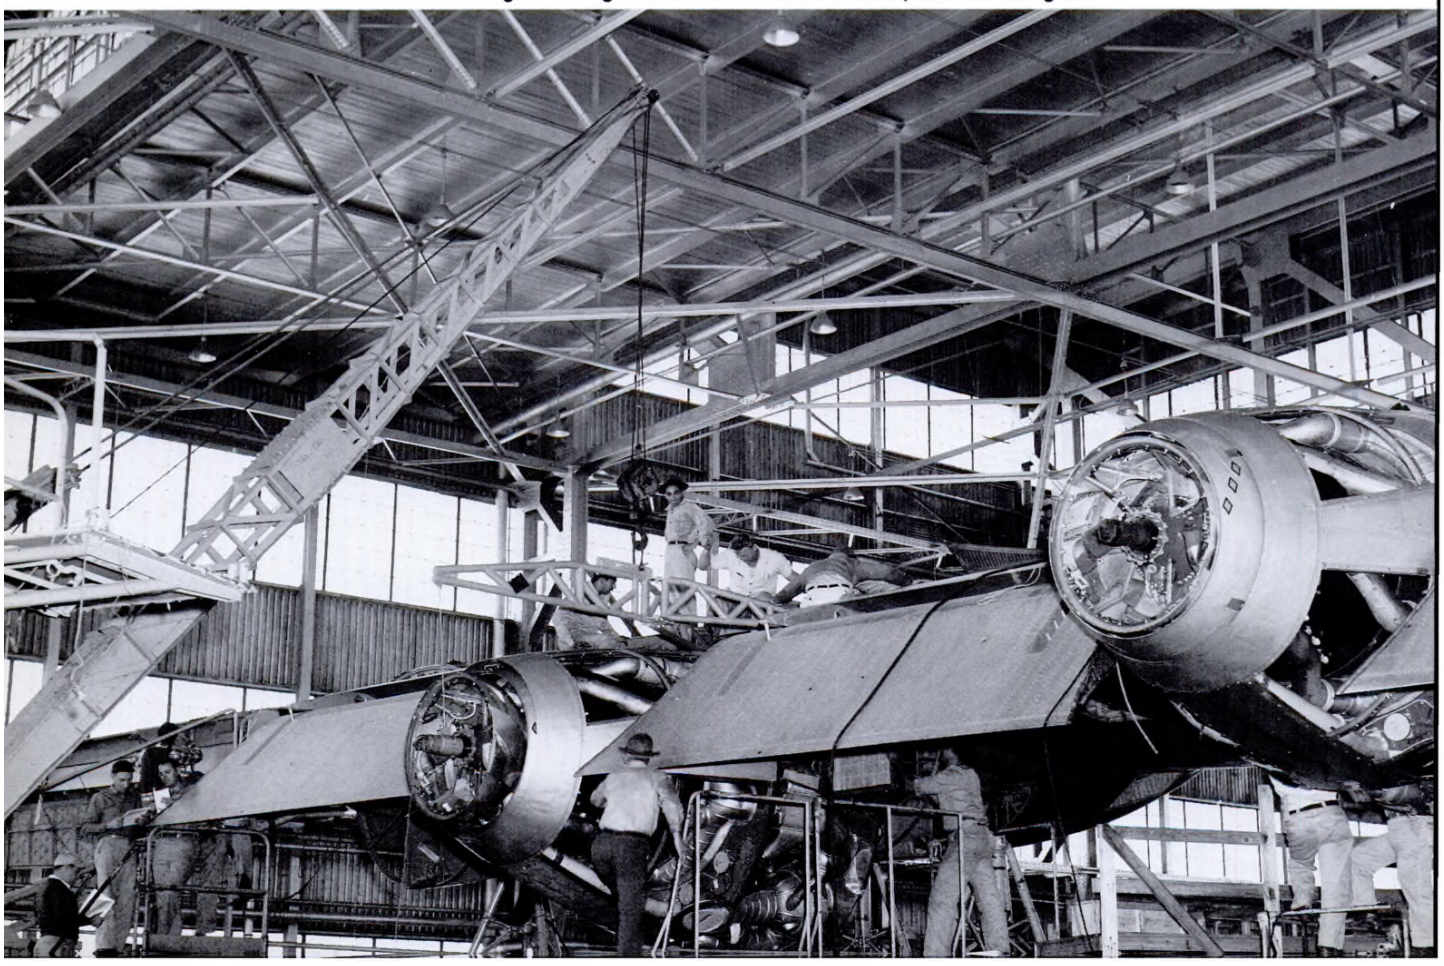

A regular on the XC-99's cargo list was the R4360 engine which weighed nearly 5,000 lbs.

flight, nicknamed "Operation Elephant," established the XC-99's fame. With ten R4360 engines and sixteen B-36 propellers in its cargo compartment, the unique airlifter took off with a payload of more than 100,000 pounds, the first time that had ever been done.

In September 1950, the Air Force transferred the XC-99 from SAC to SAAMA for a fifteen-month practical evaluation of large size transport aircraft. The goals of the operational test program included determining the plane's ability to move heavy loads for long distances, the relative direct and indirect maintenance costs, and the principal features desired in large aircraft. Air Force officials would use the XC-99's performance as a guide in their decision to move toward "super-freighters" or stay with producing smaller transporters. As the evaluation program started, the Korean conflict was placing enormous demands to get supplies to the West Coast for shipment to the Far East. On October 10, 1950, the XC-99 flew forty-two urgently needed C-54 replacement engines (twenty-seven on the lower deck and fifteen on the upper deck) from Kelly to McChord AFB, Washington, to meet the emergency. After landing,

R4360-41 engines being installed on the XC-99 aircraft, inside building 363.

The XC-99 set record after record during its life as the world's largest transport plane.

the pilot taxied the giant XC-99 down a perimeter landing strip with only one-foot clearance on each side.

After extensive modifications to make cargo loading easier, the XC-99 returned to the evaluation program and flew continuously from July 1951 to May 1952. In that ten months, the aircraft flew 600 hours and hauled seven million pounds of equipment and supplies, nearly half of which supported the Korean War.

While operational at Kelly, the XC-99 normally flew supplies to McClellan AFB, California twice a week, returning by other bases or depots depending on destination and cargo priority.

During the plane's first year at Kelly, its crew consisted of Air Force pilots and co-pilots with a special crew of civilian flight technicians. After the modifications in 1951, only military crews flew the giant aircraft. In addition to the pilot, co-pilot, radio operator, and navigator, the XC-99 crew included two scanners, two loadmasters, and two engineers. Scanners watched the flaps, landing gear, and engines, since the pilots could not see these components from the cockpit. Loadmasters directed distribution of the cargo's weight. Described as the most important men on the plane, the engineers monitored the instruments to keep the six twenty-eight-cylinder engines "purring" in harmony.

Interspersed in its regular schedule were special missions that attracted worldwide interest and attention. One of these, and perhaps the most spectacular, was the longest flight the XC-99 flew--12,000 miles to Rhein-Main Air Base, Germany. On August 13, 1953, the plane took off loaded with 61,000 pounds of vital cargo, flying via Bermuda and the Azores. It returned, following the same route, with another 62,000 pounds. At every place it landed, the XC-99 and its crew were received with interest and acclaimed by the news media. At Rhein-Main, roads were blocked on all sides of the airfield as thousands of Germans, carrying blankets and picnic lunches, came to stare.

Because of its unique capacity, the Air Force called on the XC-99 for special jobs. Supporting Project DEW LINE in May 1955, the XC-99 airlifted 380 thousand pounds of cargo 2,500 miles from Dover AFB, Delaware, to Keflavik, Iceland. Alter-

The XC-99 was the cargo-carrying giant of its day.

nating pilots and crew flew six round trips, for a total of 201 hours and 41 minutes flying time. In addition, its uniqueness often made it the highlight of various air shows around the country. It served as the centerpiece at Kelly's Armed Forces Day open house as well as appearing at air shows at Tinker AFB, Oklahoma; Bolling AFB, Washington, D. C.; and Wright-Patterson AFB, Ohio. At one point, while the plane was at Dayton, Ohio, a lady looking at the plane asked the pilot, "How do you get this thing off the ground?" "We fly it, lady," replied the pilot. Quickly came the retort, "Young man, what kind of a fool do you take me for?"

On November 1, 1954, the status of the XC-99 changed; the Air Force no longer treated it as a "project" aircraft, with special funding for maintenance. Thereafter, base mechanics scheduled and maintained the XC-99 like other Kelly assigned planes, competing with other aircraft scheduled into San Antonio Air Materiel Area shops for overhaul.

From November 1954 to the end of February 1955, the XC-99 underwent its first depot level overhaul. While repair was extensive, modification was limited for the most part to the interior, bringing the plane up to the latest standards. It was scheduled for Inspect and Repair As Necessary (IRAN) again in November 1956, but austere funding and SAAMA's programmed overhaul work load made it necessary to defer the work.

Nevertheless, the XC-99 continued flying, albeit on a reduced scale, until March 19, 1957. At that point, the consequences of failing to provide regular depot maintenance hit home. All future flights had to be cancelled because of the condition of the aircraft. Maintenance personnel estimated it would take 144,734 direct manhours and over a million dollars to return the giant airlifter to first class condition. This was too much money and too much time, considering the on-going phase out of the B-36, and it doomed the XC-99. On July 11, 1957, Headquarters AMC declared the XC-99 surplus to the needs of the Air Force. Air Force Museum officials at Wright-Patterson AFB seriously considered flying the unique craft to the museum to save it, but the cost for even this one-time flight was too high.

Six days later, on July 17, headquarters officials directed SAAMA to transfer the plane to the disposal officer for sale. This was distressing news to many people at Kelly and San Antonio who had a special place in their hearts for the XC-99. To save the unique aircraft from salvage, SAAMA donated the aircraft to the local chapter of the Disabled American Veterans on November 6, 1957. Later it was towed to a site off Kelly, near the main runway, where it still sits, decaying through age and exposure, watching the C-5s fill the role it pioneered.

The Korean War provided an outstanding operational setting to test the XC-99 when it routinely hauled large quantities of materiel around the country, proving that a large plane could carry large amounts of cargo economically over long distances. But once the conflict ended, there was not enough cargo to make continued operations cost effective. During its eight years of operation, the XC-99 flew a total of 7,434 and one-half hours over a distance of approximately 1.5 million miles, the equivalent of flying around the world fifty-nine times. It carried sixty million pounds of cargo.

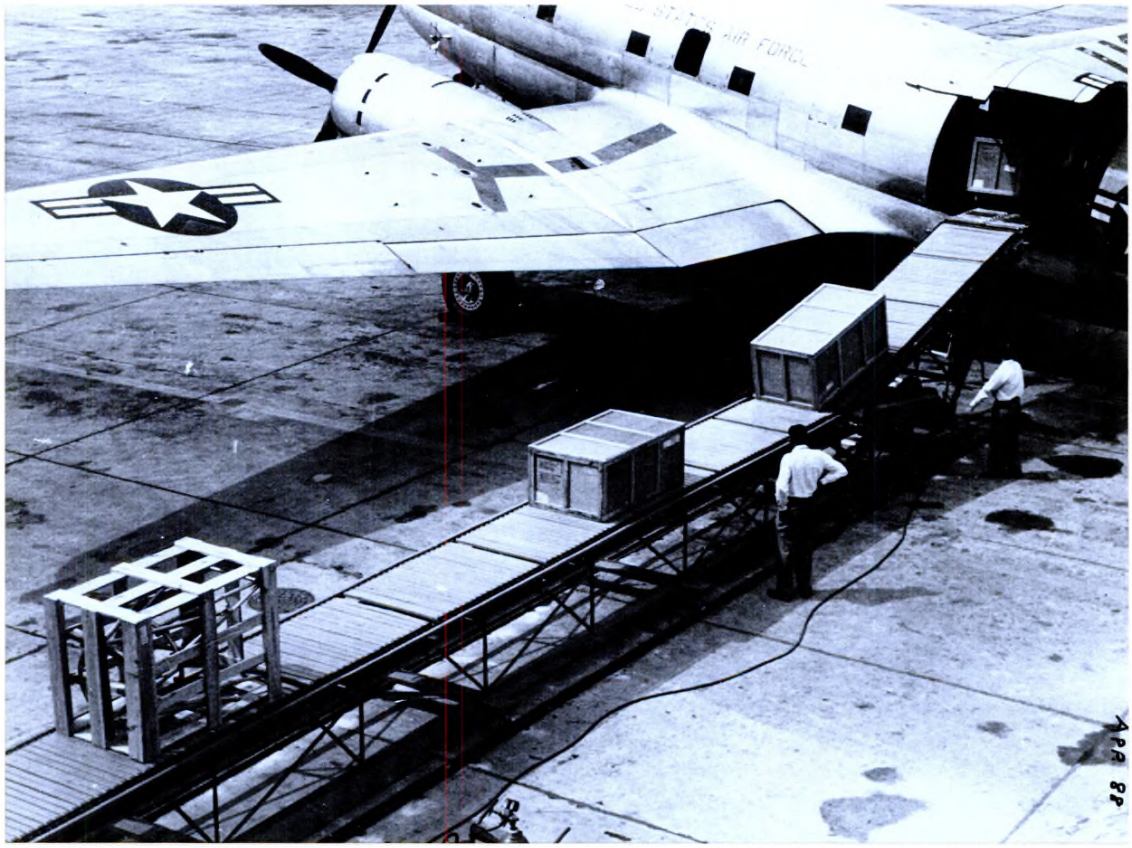

In flying this many hours and airlifting this amount of cargo, Air Force personnel learned many valuable lessons about large cargo aircraft, cargo loading and unloading techniques were improved, and the desirability of larger cargo hatches was proved. Technologically, the XC-99 demonstrated that there was no practical limit to the size an airplane could be built. But by 1957, Air Force leaders looked to missiles to provide "more bang for the buck" and believed that aircraft of this magnitude would not be needed. The future would prove them wrong.

Mechanization

In the late 1940s, as Kelly's personnel authorizations dropped, San Antonio Air Materiel Area officials began planning to mechanize to meet the demands of increased work loads with decreased personnel. By 1950, these plans had become reality; in the fall workers installed huge, overhead conveyor systems to move material in the warehouses in building 4212 on East Kelly and building 171 on Central Kelly. By eliminating much of the manual work and cutting out extensive "lost motion," mechanization cut warehouse processing time in half. Supply officials even extended the benefits of mechanization to speed up records keeping, statistical data gathering, and other necessary paperwork. Conveyors also moved equipment and parts along the maintenance production lines. New automated machines tremendously increased the number of spark plugs overhauled.

In 1951, mechanization efforts succeeded in speeding up aircraft and truck loading and unloading. In April, Supply officials unveiled a new automatic conveyor system that moved cargo between parked aircraft and the loading docks at the air freight terminal. General Clements McMullen suggested the idea, which a Kelly engineer designed and Maintenance workers built. During the trial run, the conveyor system unloaded 4,774 pounds of freight in just eight minutes, an operation that normally took an hour or longer with trucks and dollies.

Supply took another step toward mechanization in 1952 with the opening of the world's longest overhead conveyor system that linked six North Kelly warehouses. Use of the system, a Kelly project from design to construction, to move material between receiving and screening lines and warehouses to a newly established central packaging and shipping area, cut processing time by fifty percent. Work at Kelly would never be the same again!

Kelly engineers designed and built the automatic conveyor system to carry cargo between the parked plane and the air freight terminal.

Global Reach: New Organizations and Responsibilities

Decentralization

As Air Materiel Command entered the 1950s, it sought ways to enhance the effectiveness of its logistics system. One of these was the initiative to decentralize the operational work load at the headquarters, which had become "top heavy" with too many responsibilities. Begun in April 1952, AMC leaders hoped to improved responsiveness and allow the headquarters to focus on its policy and planning functions rather than spending time on day-to-day operational matters. And, as superpower antagonism increased, AMC officials wanted to reduce the vulnerability of Air Force logistics by making the AMAs and depots self-sufficient, able to act without waiting for orders from the headquarters.

Under the decentralization program, the prime depots assumed responsibility for certain aspects of procurement, worldwide depot support, and stock control for components as well as for complete aircraft and engines. San Antonio AMA received worldwide responsibility for property classes dealing with Convair aircraft (including the B-36 and XC-99), Pratt and Whitney engines, and certain airborne communications equipment. New depot responsibilities included initiating purchase documents, executing contracts, computing requirements, preparing budget estimates, and having complete control of distribution and redistribution of items in its assigned property classes. This decentralization program, the biggest innovation in AMC operations since the beginning of the Two-Zone System in 1948, marked the AMAs' entry into the field of logistics management.

To perform the new functions, San Antonio Air Materiel Area's directorates had to form new offices. One of the first was the establishment the Procurement Office, which formerly had been a section in the Directorate of Supply and Services. In October 1951, it became a separate staff office under the Air Materiel Area commander. On July 1, 1952, the office dropped its administrative link with Supply and became SAAMA's third directorate, the Directorate of Procurement. Six months later, on December 18, a Small Business Specialist was appointed at Kelly for the first time to encourage buying goods and services from small firms.

Another organizational change which took place on July 1, 1952, was the establishment of the Deputy for Requirements and Distribution in the Supply Directorate to compute materiel requirements, initiate purchase requests, and determine funding for SAAMA's prime classes. For the first time, AMA personnel became involved with long range planning as they attempted to determine worldwide requirements and funding two years in advance. In addition to working future Air Force requirements, the decentralization program gave the AMAs another totally new responsibility -- planning for the logistical needs of foreign air forces in the Mutual Defense Assistance Pact.

Directorate of Maintenance and Engineering officials established two organizations to handle the new responsibilities gained with decentralization. On October 15, 1952, the new Technical Service Division officially began operating. A small cadre of personnel came down from AMC headquarters in July to teach Kelly employees their new jobs -- writing technical orders and service bulletins, determining final corrective actions for unsatisfactory reports, processing aircraft accident reports, and evaluating engineering change proposals for equipment in SAAMA's prime property classes. A month later, on November 18, the Command Work Load Control Office began operations. It was responsible for scheduling depot level repair for SAAMA's prime class items. Since the B-36 Field Service Office already performed some of these functions, it became the nucleus around which the Command Work Load Control Office was organized.

Headquarters AMC also decentralized contract administration. On October 1, 1953, the AMAs assumed responsibility for administering contracts, reviewing quality, and monitoring production, a job that had been done previously by six air procurement districts. By eliminating the procurement districts, the command hoped to cut out duplication of effort and free needed manpower authorizations for higher priority work loads. San Antonio AMA became responsible for the work load previously handled by the Southern Air Procurement District at Fort Worth and took control of six Air Force plant representatives located at the Aircraft Engine Division for Ford Motors, Nash Kalvinator Corporation, Phillips Petroleum, Beech Aircraft Corporation, and Consolidated-Vultee at plants in Texas and California. This arrangement lasted until the 1960s when Air Force Systems Command assumed these responsibilities.

Lieutenant Colonel Guy Hix (on left), Kelly's Home Owning Consultant, worked with Kellyites to find suitable housing. With Colonel Hix is Adelene Hodges, Helen Collins and George Cardenas.

Kelly's Home Owning Consulting Service

General McMullen's popularity with Kelly workers came from the knowledge that they were important to him. One of their more serious problems after the war was the scarcity of adequate housing. While the opening of Billy Mitchell Village alleviated housing shortage for Kelly's military personnel, many of the base's civilians still had difficulties not only in finding a house, but also understanding the intricacies of mortgages, points, and financing. To help Kelly's people find housing, General McMullen established the "Buy-a-Home" program in March 1951 and appointed his assistant, Lieutenant Colonel Guy F. Hix, as the base's home owning consultant.

Colonel Hix had a genuine interest in his job, and his work paid off. Between March 1951 and November 1952, he helped Kelly employees buy homes worth $3.5 million, saving them thousands of dollars. His "customers" were a varied group, ranging from a worker whose home was destroyed by fire, to a family who grew too large for their home, to the first employee who came to Kelly from Wright-Patterson Air Force Base with the AMC Decentralization Program.

In April 1952, the San Antonio Home Builders Association recognized Kelly's unique home owning consultant service. The real success story, however, was the hundreds of Kelly families who were helped. Kelly cares.

Inspect and Repair as Necessary Program

As the Cold War and the soaring prices of new technology pushed the defense budget upwards, presidential and congressional pressure forced the military to control the costs of normal operations. One response to this pressure was the Inspect and Repair as Necessary (IRAN) program. Kelly mechanics first began using the IRAN concept on July 1, 1953. The purpose behind the IRAN concept was to produce an aircraft, engine, or component that would operate safely and efficiently until its next reconditioning cycle without spending extra time, money, or effort.

Previously, workers took apart an item undergoing depot-level repair, inspected it, reconditioned it by changing out anything that was questionable, and returned it to the using command in "brand new" condition. This practice often meant changing out items that did not affect operational capability or replacing an entire component rather than just the damaged part. As a result, depot personnel were overloaded with nonessential work, which added to the costs and kept the aircraft out of service longer. By only replacing or repairing those parts that needed it, the cost of depot maintenance was halved and aircraft spent less time waiting on maintenance. Both AMA and using command personnel had a difficult time adjusting to this new depot maintenance philosophy, but by 1956, it had become standard procedure.

New Organizations

2837th Specialized Depot Group

As the atomic bomb became the cornerstone of American security policy after the war, the military services established various organizations to work with nuclear weapons. Strategic Air Command crews and aircraft would deliver the nuclear blow, but the Air Force needed an organization dedicated to the management and repair of nuclear weapons, components, and kits. In July 1950, a small cadre of fourteen men transferred from Kelly to Kirtland AFB, New Mexico, to set up an organization for this nuclear support mission. Five months later, on November 20, AMC officially activated the 2837th Specialized Depot Group at Kirtland and assigned it to SAAMA.

However, the new group had problems finding enough personnel to carry out its assigned mission of providing concentrated storage, distribution, and maintenance of special weapons, kits, weapon and kit components, and training equipment. On top of this, there was a housing shortage at Kirtland, creating problems for the group's personnel. Hoping to solve these problems, AMC officials decided to move the group back to Kelly. By the beginning of 1952, planning to move the 2837th was well underway. In January, work started on the group's new home, building 1556, which would provide office space, storage, and shop facilities. Kelly's Civilian Personnel Office concurrently began recruiting workers to fill the group's vacancies. On February 14, 1952, Headquarters AMC published Movement Orders Number 1, authorizing and directing the SAAMA commander to move the 2837th Specialized Depot Group from Kirtland to Kelly, with all of its organizational equipment and stocks on hand, including active Class 09-D items (nuclear ordnance commodity managed items) and other items not available at the south Texas base.

Twenty-eight people made the move from Albuquerque to San Antonio, including eight of the original fourteen group members, in three stages: on February 8, 14, and 22. The depot became operational on February 20, 1952, and passed inspections in March, which certified the group as capable of performing its Atomic Energy Commission mission. By June almost all of the supply positions were filled, but because of the Top Secret clearance requirement and unusual type of repair work involved, it took longer to hire qualified maintenance workers.

The AMC Decentralization Program affected the 2837th Specialized Depot Group, too. New responsibilities gained included cataloging, requirements and distribution, and budget computation for nuclear equipment. The group would also be responsible for distributing special weapons publications to the appropriate Air Force units. At the same time, the military was revising management of nuclear resources, taking over control from the Atomic Energy Commission, which had handled nuclear management since the war. The Secretary of the Air Force gave logistical responsibility to AMC, which, in turn, delegated it to SAAMA and the 2837th. On January 1, 1953, AMC named the 2837th Specialized Depot Group as SAAMA's fourth directorate -- the Directorate of Special Weapons -- and inactivated the depot group the following August.

Lieutenant Colonel Theodore Witt, 19th Logistics Support Squadron Commander, congratulated the first crew to complete 1000 hours in the C-124 aircraft.

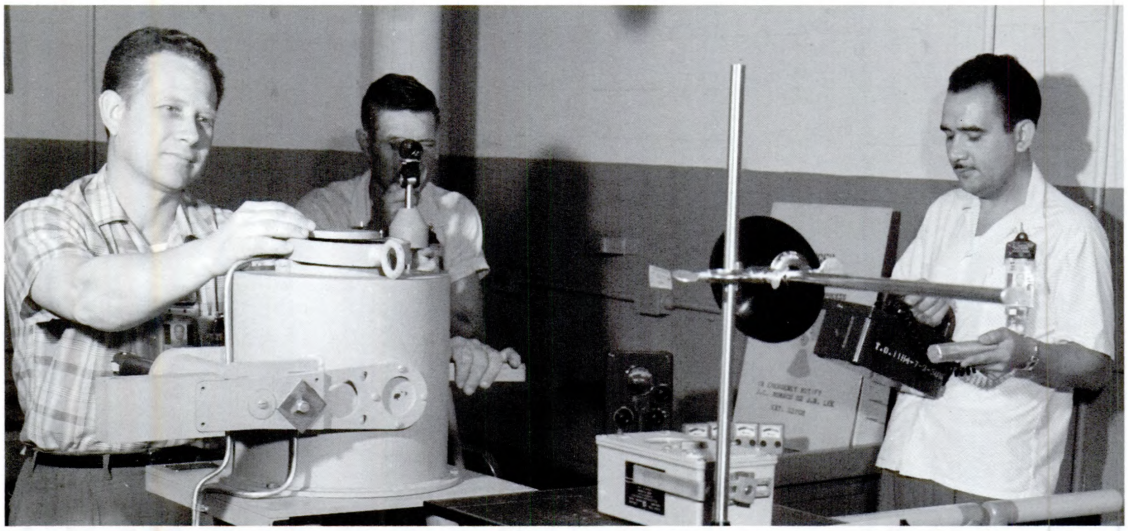

19th Logistics Support Squadron

On September 24, 1952, Headquarters Air Materiel Command activated a new organization at Kelly, the 19th Logistics Support Squadron. The first squadron of its kind, the new squadron was formed to provide worldwide airlift in direct support of special weapons. It remained at Kelly throughout its thirteen year history. The first C-124 assigned at Kelly arrived in September 1952 for the new organization. Within just a year, the pilots and crews of the 19th Logistics Support Squadron were hauling more cargo than any other freight-hauling unit on Kelly. In September 1953, the squadron ferried 662 thousand pounds of cargo in just thirty-two hours of flying time.

The 19th's safety record was truly amazing. In over thirteen years, it had only one accident. Flying relief supplies to hurricane and flood victims in the British West Indies in August 1956, one of its C-124 aircraft landed short of the runway, crashed and burned. One crew member died, but the others received only minor injuries.

The 19th Logistics Support Squadron served under several organizations during its thirteen years. Originally activated as a unit under the San Antonio Air Materiel Area, the 19th became a part of the 3079th Aviation Depot Wing, Wright-Patterson AFB, Ohio, on February 6, 1955. On July 1, 1962, the squadron went under jurisdiction of the 39th Logistics Support Group, a new Kelly organization. That lasted only a year, however, for on July 1, 1963, the 19th left AMC for the Military Air Transport Service as a member of the 62nd Air Transport Wing, McChord AFB, Washington. On July 8, 1964, the unit was redesignated the 19th Air Transport Squadron (Special) and then the 19th Military Airlift Squadron (Special) on January 1, 1966. As a part of the Military Airlift Command, successor to Military Air Transport Service, the 19th's job was to provide military airlift of personnel and cargo in either a wartime or peacetime environment in support of MAC's global mission.

As a result, the Kelly-based squadron saw service during the Cuban Missile Crisis in 1963, earning an Air Force Outstanding Unit Award, and hauled cargo to Southeast Asia during the Vietnam War. On November 13, 1969, the last C-124, carrying helicopters to Tan Son Nhut Air Base in South Vietnam, "lunged" from Kelly's concrete runway on the final mission flown by the 19th Military Airlift Squadron. The 19th, a victim of defense cutbacks, was deactivated on December 22, 1969. The deactivation of the unit, and its final C-124 flight, marked an end to another year of Kelly history.

Personnel with Kelly's Directorate of Special Weapons performed a variety of tasks to manage nuclear weapons for the Air Force.

Other Air Force organizations transferred nuclear responsibilities and work loads to SAAMA's unique directorate. On July 1, 1956, the Directorate of Special Weapons became the Nuclear Ordnance Commodity Manager for the Air Force, providing a single point of contact for the logistical support of nuclear material. Its responsibilities included nuclear weapon control, nuclear safety and security, training weapons, ground handling and test equipment, retardation devices, technical data, test programs, and plans.

The Air Base Wing Concept

Command officials had reviewed the relationship between the area headquarters, depot, and the base intermittently since World War II. Prior to 1944, the area air technical service commander, the depot commander, and the base commander (all located on one installation) had separate missions and more than enough to do; but in January 1944, responsibility for the sub-depots shifted from the area air technical service commands to the major commands the sub-depots supported. This left only the air depot and the base under jurisdiction of the area commander who, naturally, became increasingly interested in these operations. In November 1944, these three operations were integrated, and the commander of the San Antonio Air Technical Service Command became commander of Kelly Field.

While this caused some administrative problems, it worked fairly well until 1952. As the air materiel areas assumed more and more management responsibility from Headquarters AMC, the job of AMA commander became increasingly complex. At this point, AMC officials argued that the area commander was so preoccupied with the details of running the base he had little time to devote to the larger and more pressing problems of AMA operations. They believed having a separate base commander would free the area commander from the responsibilities of base operations. In May 1953, AMC successfully tested the base commander organization concept at San Bernardino and Ogden AMAs and extended its implementation at the remaining AMAs. On August 1, 1953, AMC designated and organized air base wings at each of the AMAs. Kelly's was the 2851st Air Base Wing, commanded by Colonel Laurence A. Growden.

Basically, the plan delegated the functions of the base executive to the air base wing. It also dual-hatted some responsibilities in both organizations to avoid duplication: although assigned to the 2851st Air Base Wing, the air installation, services, and personnel officer, along with the commanders for depot training and medical services, served on the AMA staff; while the comptroller, adjutant, inspector general and staff judge advocate, who worked for the SAAMA commander, were also a part of the air base wing staff.

While Kelly fell in step and had a separate base commander, the San Antonio Air Materiel Area commander, Major General Thetus C. Odom, was reluctant to relinquish his role as Kelly commander. In a December 1954 letter to the AMC commander, General Odom wrote, "The Wing-Base concept assumes the AMA commander, while being the depot commander, does not command the base on which the depot is located. I believe the depot and the base are one and the same."

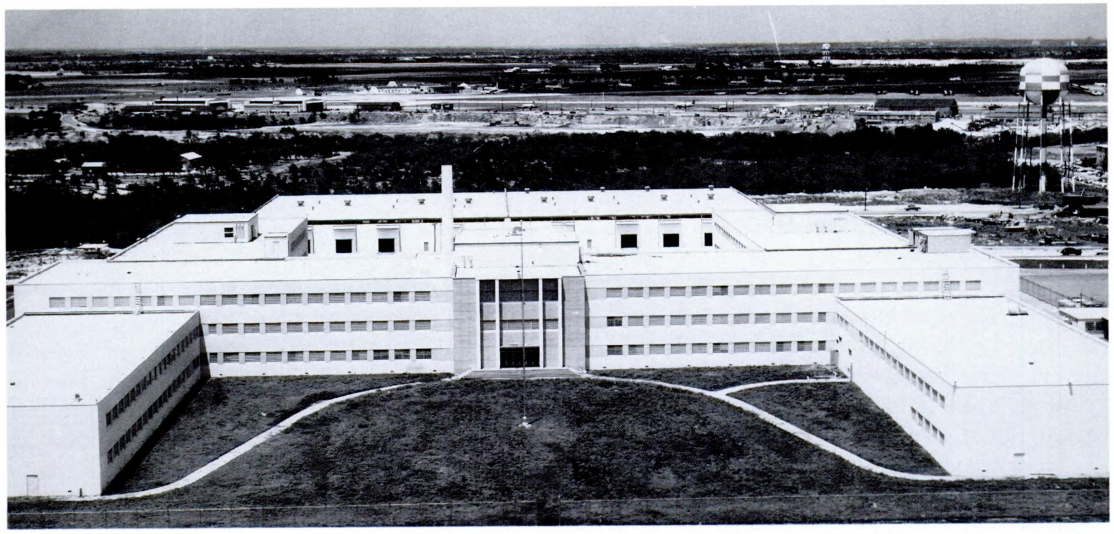

Furthermore, the SAAMA history for January to June 1955 states, "Recognizing the fact the base commander (or wing-base commander) had never actually functioned as such at Kelly since the implementation of the 'base commander' organizational concept of 1 August 1953 . . . ."

General Odom recommended giving the air base wing commander the additional duty of Director of Support Activities. As such, he would serve on the AMA staff and deal with the day-to-day operation of the base, but keep title of commander to handle court martials and other military justice responsibilities. This way, the SAAMA commander would be relieved of running the base but retain the title of Kelly Air Force Base commander.

Obtaining approval to modify the standard AMC organization to meet General Odom's views proved laborious. Finally, on March 10, 1955, Headquarters AMC authorized a six-month test of the Directorate of Support Activities, but several more months passed before SAAMA received approval to implement the other changes it wanted. Finally, on July 1,

Colonel Laurence A. Growden, the first 2851st Air Base Wing Commander (extreme left), presides over a brief ceremony commemorating the 42nd anniversary of Lieutenant George E.M. Kelly's death.

The United States Air Force Security Service (renamed the Electronic Security Command in 1979) moved its headquarters from Brooks AFB to Kelly in 1953.

San Antonio Air Materiel Area implemented its Director of Support Activities organization and used the Support Activities Directorate for the next five years until AMC once again pushed for organizational standardization among the air materiel areas.

Security Service Moves to Kelly

Kelly became home to another organization during the summer of 1953 when the United States Air Force Security Service moved into its new headquarters on "the Hill" at Kelly. Headquarters Air Force organized Security Service as a major command in October 1948 to manage Department of Defense cryptologic operations, provide communications security services for the Air Force, and maintain a data and analytical center for electronic warfare planning and operations. In May 1949, Headquarters Security Service moved to Brooks AFB, Texas, where it occupied the old wartime station hospital array of pavilions and adjoining barracks.

In 1951, the Air Force decided to move Security Service (renamed Electronic Security Command in 1979) to the area called "West Kelly," adjacent to Lackland AFB. A complex consisting of a $4 million, three-story headquarters building; barracks for enlisted personnel; and an 80,000 square-foot warehouse for its sophisticated electronic and cryptographic equipment was built for the command. Completed in the spring of 1953, it took Security Service personnel a month, between July 15 and August 15, to move into the new facilities. The command headquarters is now the largest associate unit on Kelly AFB.

New Responsibilities

The B-36, with its R4360 engines, was the last of the great reciprocating engine aircraft that came out of World War II. By the late 1940s, it was clear that jet propulsion was the wave of the future. During the last six months of 1952, Kelly received its new aircraft assignments. As manager for the Convair aircraft in the Air Force's inventory, its new responsibilities included aircraft components for the YB-60 bomber (a modified, all-jet version of the B-36 of which only two were built); the C-131 "Samaritan;" and, perhaps most significantly, the F-102 "Delta Dagger."

Two years later, in the last half of 1954, Air Materiel Command assigned San Antonio Air Materiel Area specialized repair responsibility of the Air Force's newest strategic bomber, the B-52 "Stratofortress." Oklahoma City Air Materiel Area was designated "prime" or "lead" depot for the new heavy bomber.

Kelly entered the jet engine business relatively late. On August 4, 1953, SAAMA received its first jet engine responsibility when Headquarters AMC designated it a minor repair activity for the J48, J33, J35, J47, J57, and J65 jet engines. Of these engines, perhaps the most significant was the J57, powerplant for the early model B-52, F-100, and F-102. On February 26, 1954, SAAMA's engine shops received their first jet engine, a J33A, for repair. While Kelly workers tested and made minor repairs to these Pratt and Whitney engines, most of SAAMA's responsibility lay in management, including all documentation to ensure the engines were produced and delivered on time.

San Antonio Air Materiel Area picked up prime and specialized overhaul responsibility for the Pratt and Whitney T34 turbo-prop engine in the last six months of 1954. This was the first jet engine for which Kelly had prime responsibility. The first T34 engine arrived at Kelly during the last week in January 1955. Engine Division personnel used this semi-production model to set up the training program for the new engine.

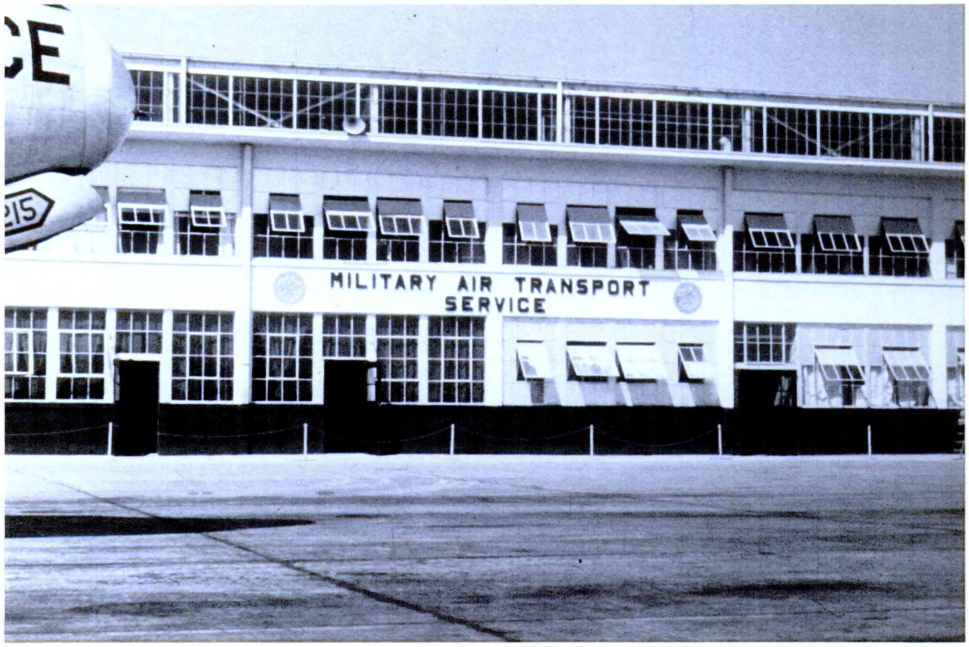

The T34 turbo-prop engine was the first jet engine for which Kelly had prime responsibility.

From this "humble" beginning, the south Texas depot would progress toward an ever deeper involvement in the maintenance and management of turbo-prop engines, including the T50, T54, and T56. The first T56 engine arrived at Kelly the end of November 1955, and once again, Engine Personnel used it to prototype their repair procedures before going into full production. Thirty-six years later, Kelly personnel were still working with the T56 turbo-prop engine.

Kelly assumed new responsibilities in the 1950s, including those for the C-131 "Samaritan."

Kelly's Continental Connections

At the close of World War II, the Army Air Forces' Air Transport Command (ATC) operated the Military Air Transport Service, a worldwide transportation system to carry cargo and passengers; an aeromedical evacuation system with a fleet of hospital planes; and Ferry Control. Within a year of V-J Day, consolidations and inactivations had cut the number of ATC's operating divisions from nine to three, but Kelly benefited from this downsizing. On April 30, 1946, representatives of the San Antonio Air Technical Services Command and ATC signed an agreement, granting ATC use of Kelly Field. The facilities ATC gained at Kelly included use of a freight and passenger terminal (building 1614) and ramp space, but no hangars. Its personnel had to maintain its fleet outside under the blazing Texas sun. In just two short weeks, May 15, ATC's 5th Air Transport Group inaugurated "The Alamo," the all-military, scheduled passenger service between San Antonio and Washington, D.C. In the first month alone, "The Alamo" carried nearly one million passengers.

Further budgetary and personnel reductions forced ATC to consolidate even more. In October 1946, ATC announced it was expanding the Military Air Transport division at Kelly, making San Antonio the hub of its operations within the continental United States. With ten C-54s flying into and out of Kelly, the 5th Air Transport Group ferried almost 6,000 pounds of cargo and over 1,000 passengers a month. In January 1947, Kelly became a stop for C-54 "Samaritan" hospital planes on their run between Westover AFB, Massachusetts, and Travis AFB, California.

Passage of the National Security Act of 1947 increased the pressure for unifying similar functions within the military. An obvious choice was the consolidation of the air transport systems run by the Air Force and the Navy. On June 1, 1948, the Naval Air Transport Service officially joined with the Air Transport Command to form the Military Air Transport Service (MATS) to operate a global air transport system for the Department of Defense. Consolidated operations preceded the formal organization of the Command, however, for in February, Kelly's air transport group assumed operational control over all scheduled C-54 domestic cargo flights. During the first month of consolidated operations, the group moved 3.2 million pounds of cargo. That amount had increased to 4.4 million pounds by April. In June 1948, Major General Bob Nowland arrived to take command of MATS' newly activated Continental Division, with its headquarters in today's building 3030 on East Kelly.

Activation of new operational groups quickly followed establishment of the Continental Division. By December 1948, Kelly was home to the 1700th Air Transport Group. The Korean War forced a tremendous expansion of military air transport systems; by the end of 1950, the 1700th Air Transport Group had five air transport squadrons, a ferrying squadron, a maintenance squadron and an air traffic squadron operating under it. Within a year, the ferrying squadron had grown to the 1708th Ferrying Group.

Military Air Transport Service units continued to call Kelly home until 1958, when Headquarters Air Force announced a consolidation of MATS operations. Kelly's Headquarters, Continental Division, with its operational units, transferred to Travis AFB in June, where it was redesignated as Headquarters, Western Transport Air Force. After ten years, Kelly AFB lost one of its oldest and best known associate organizations.

The Changing Face of Kelly

More Land and New Facilities

As the new aircraft developed after World War II grew larger and their engines became more powerful, the buildings and runway complex built on the field in the 1930s and 1940s seemed to shrink, dwarfed by the mammoth aircraft resting on the maintenance ramps. During the 1950s, the base experienced its largest construction boom since 1944. The face of Kelly changed forever as construction began on the largest aircraft hangar in the world and the old Kelly Number 2 flight line was torn down to make room for the new two-mile-long runway.

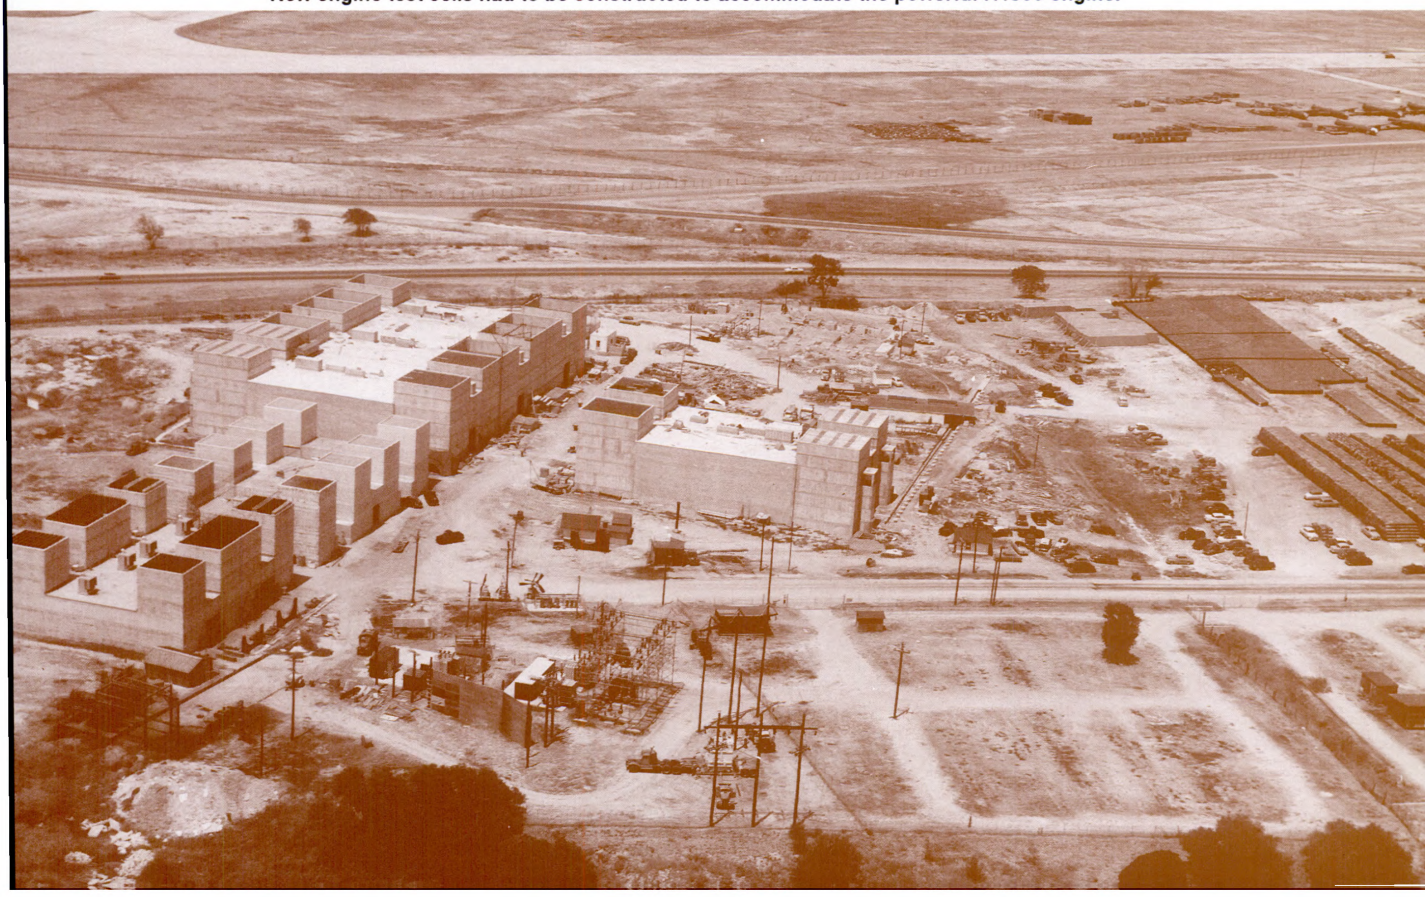

Throughout the 1950s, work also continued on Kelly's engine test cells located at the southwest corner of the base. As new aircraft engines entered the Air Force inventory, SAAMA constantly had to build new test cells or remodel old ones to accommodate more powerful engines. Contractors built large propeller-type test cells for R4360 engines and even larger ones for higher horsepower reciprocating engines and turbo-prop engines. Test cells for jet engines also became necessary as SAAMA got more heavily involved in jet propulsion.

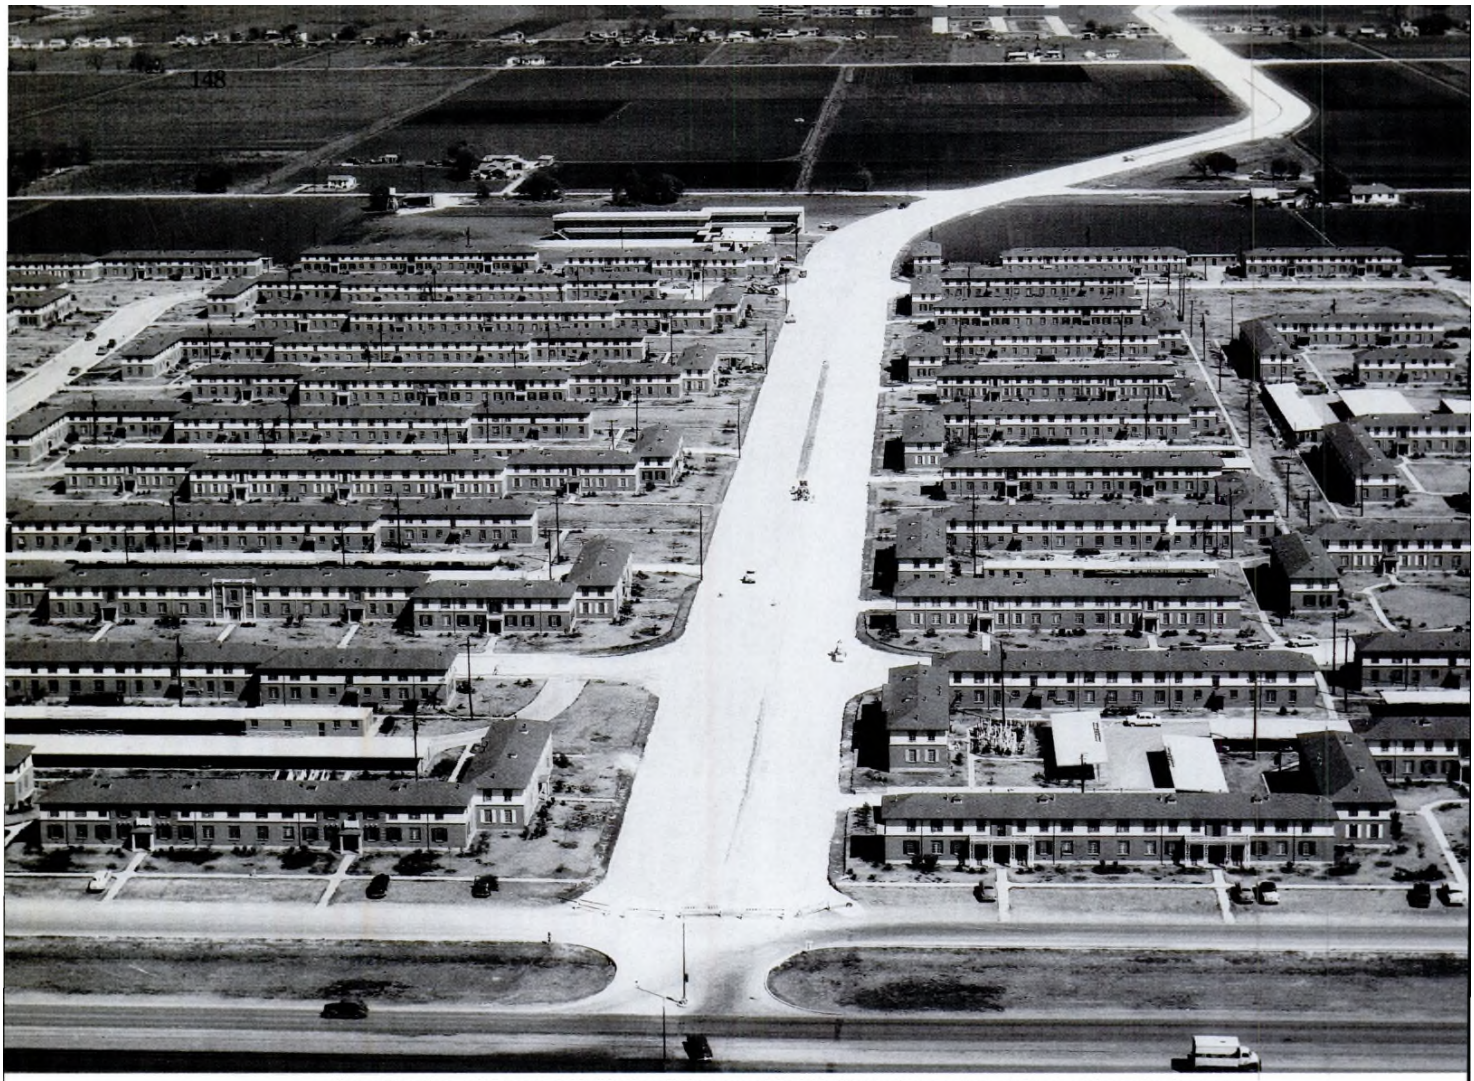

New depot maintenance facilities also appeared during this time. Completed in the latter half of 1952, the new fuel accessories facility was built initially for repair of R4360 carburetors and fuel injection systems. Building 308, the communications or avionics building, was completed in April 1953 and contained an elevated tower for testing radio and radar equipment.

General McMullen Drive

With over twenty thousand workers, getting on and off of Kelly was a nightmare. Only a few roads came into the base, and traffic jams were the norm rather than the exception. After extensive surveys affirmed the need and feasibility for such a thoroughfare, Air Force and city plans to extend Stephenson Road to create an access road to Kelly and Lackland AFBs moved closer to reality in 1951 when San Antonio's City Council authorized purchase of the necessary rights-of-way for the road within the city limits. In 1952, the Bureau of Public Roads decided that the Stephenson Road extension qualified for the Military Access Road Program, which meant congressional appropriations would pay for its construction. Final plans, forwarded to Washington, D. C. in

New engine test cells had to be constructed to accommodate the powerful R4360 engine.

Construction of General McMullen Drive provided Kelly workers a "straight shot into the base."

called for a divided thoroughfare from Kelly to Culebra Road and a regular four-lane road from there to Bandera Road. Finally, on July 27, 1953, the Bureau of Public Roads allocated $1.05 million for the road. Actual construction started in October.

As H. B. Zachry workers began the new road, the City Council announced it was naming the road General McMullen Drive, in honor of San Antonio Air Materiel Area's retiring commander. (General McMullen retired on February 28, 1954.) Work progressed at such a rapid pace that the first portion of the road, from Billy Mitchell Village to Anderson Road, opened on April 8, 1954. Base officials expected even this small portion to help relieve Kelly's traffic congestion at quitting time. The entire 4.4 mile stretch of road between Kelly and Culebra was completed in July and gave those Kellyites living on the north side of town a "straight shot" into the base.

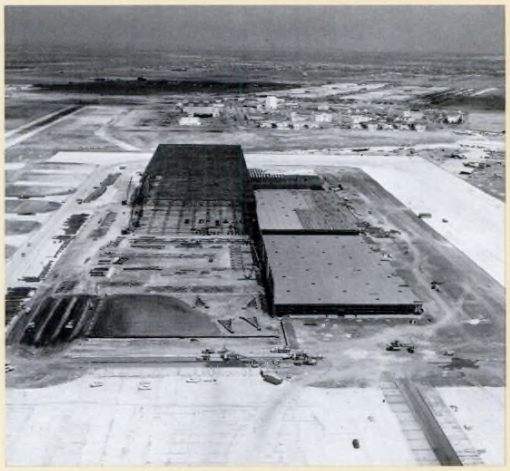

The "Big Hangar"

But of all these facilities, perhaps the most significant was the one included in the fiscal year 1953 military construction program budget--a combination of aircraft maintenance shops and hangar space, which became the largest single structure ever built by the Air Force. Previously, Kelly mechanics either worked on aircraft in building 324 (completed in 1933), or on an outdoor production line, under the searing Texas sun in the summer and in the cold during the winter.

With the advent of the B-36, aircraft became too large to fit into Kelly's existing facilities, so in 1951 San Antonio Air Materiel Area's Maintenance officials began planning for a hangar large enough to house ten B-36 bombers undergoing assembly-line repair simultaneously.

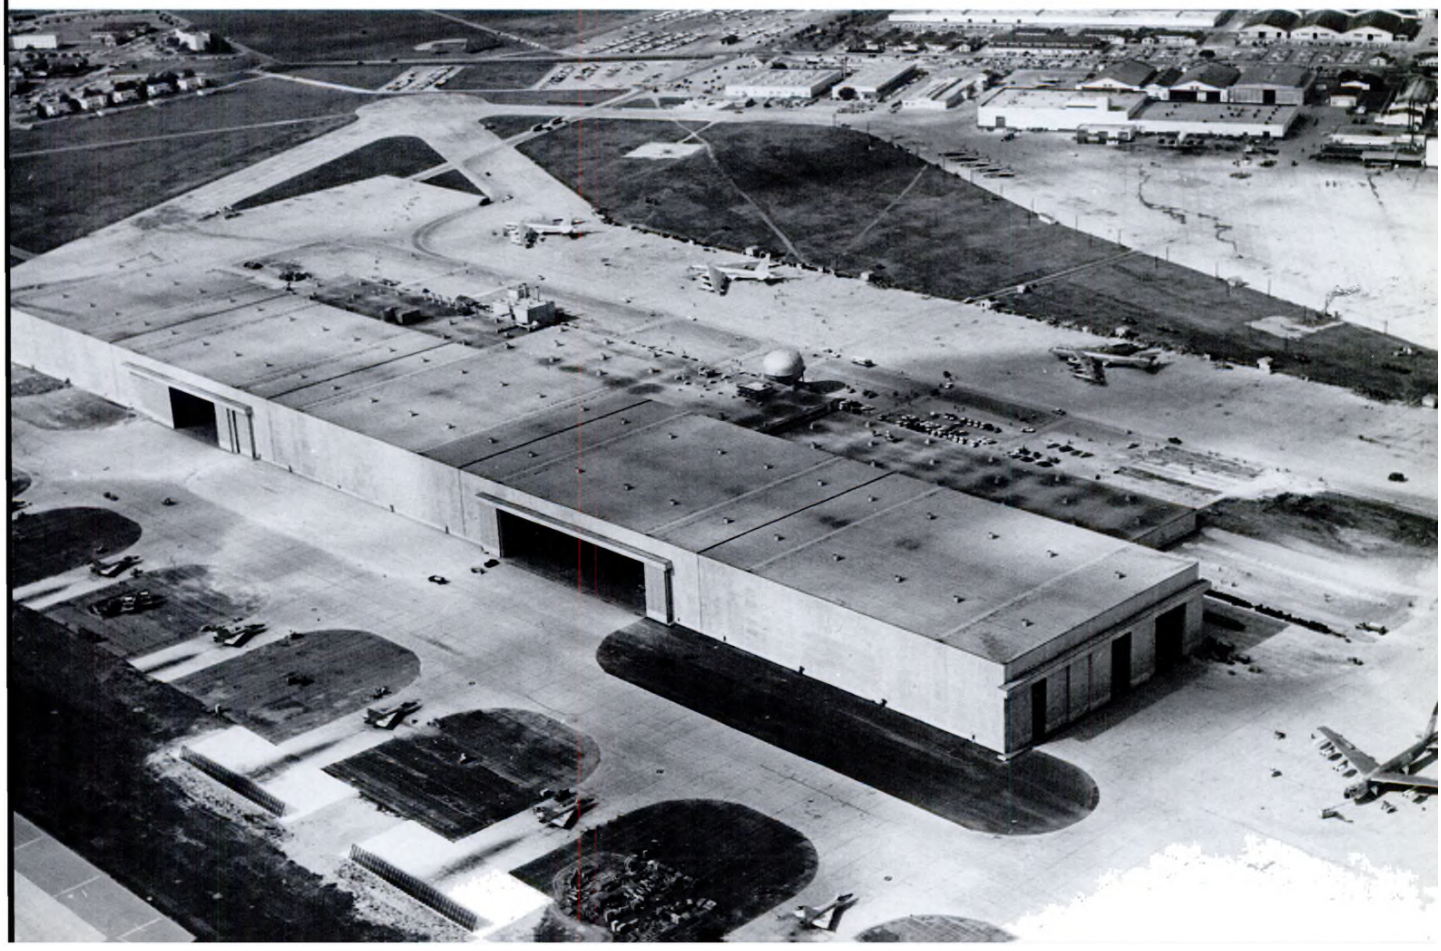

Construction began on November 17, 1953, when 200 thousand cubic yards of earth were excavated. Contractors installed four miles of underground drainage lines before laying down a "Texas-sized" apron or ramp, consisting of forty-four acres of sixteen-inch-deep concrete. By the end of 1954, all 13,000 tons of structural steel was in place, the roof over the shop portion of the building was completed, and most of the roof over the hangar was in place. Support for the 1.25 million-square-foot facility (the equivalent of twelve football fields) came from rigid trusses weighing 300 tons each. The architects used bridging principles in the building's design -- the walls bear the entire weight of the building. There are no internal columns for support on the hangar floor.

With the "Big Hangar," Kelly had its aircraft production line and supporting shops under one roof for the first time. San Antonio AMA officials ceremonially opened the "largest hangar in the world" on February 15, 1956, although the first group of maintenance workers did not move into the huge building until July. Two B-47s were the first aircraft to move off the sun-baked overhaul line into the hangar's "high bay" area.

As early as 1945, Kelly AFB officials had been planning for construction of the "Biggest Hangar in the World."

The "Big Hangar"

Kelly's new runway officially opened on March 16, 1956.

Demise of the Kelly Number 2 Flight Line

The old flight line on Kelly Number 2 saw the Air Force grow from linen-covered Jennies to aluminum-skinned transcontinental bombers. For thirty-eight years, most of the pilots in the Air Service, Air Corps, and Army Air Forces earned their wings at Kelly. The walls of its old World War I era hangars reverberated with the sounds of JN-4s, P-12s, and AT-6s roaring to life, while the buildings that housed the Advanced Flying School echoed with the voices of young men honing their flying skills; young men like Ira Eaker, Charles Lindbergh, Claire Chennault, and Nathan Twining. But the old historic flight line became a victim of progress. Kelly's runway complex built in the 1940s was too small for new jet bombers like the B-52 and B-58. Base officials began planning for a "super" runway in 1954, which would run right through the middle of the old Kelly flight line and its tiny hangars, officer quarters, cadet barracks, offices, classrooms.

Early in 1955, demolition crews began tearing down the old wooden buildings that made up the old Kelly Number 2 flight line to make way for the new runway. A San Antonio construction firm, H. B. Zachry Company, won the contract for the 300-foot-wide, 11,550-foot-long, $4.6 million runway. Preliminary work began in February, but the actual ground breaking ceremonies did not occur until March 23. To accommodate the two-mile-long runway, the Air Force had to buy 461.86 acres of farm land known as the "old Belgian Gardens." Some of the farmers living on the land loudly complained that they had not received fair market value for their acres. For a while, local newspapers published their objections, but as this produced little reaction from most San Antonians, the complaints died a natural death.

Not only did Kelly's historic flight line fall victim to the new runway, but so did Andrews Road that ran along the old flight line, connecting Lackland and Kelly AFBs. Plans called for construction of a new road that would go around the north end of the runway. Adding seven extra miles to the road between Kelly and Lackland caused an uproar among those Lackland personnel living in Kelly's Billy Mitchell Village and Billy Mitchell Village businessmen. They proposed building a tunnel under the runway instead of rerouting traffic around the perimeter. Reality prevailed, however, once Kelly officials explained the enormous cost of such a project and the safety aspects involved. The old Kelly-Lackland road closed on May 30, 1955, and it was permanently severed on October 17. All subsequent traffic had to use the new perimeter road. On September 29, 1956, the San Antonio City Council honored Colonel Laurence A. Growden, the first

Construction of the new Special Weapons building began in May 1954. Integration of Special Weapons functions--materiel management, supply, maintenance and quality control--into a single facility solved a major maximum security problem.

commander of Kelly's 2851st Air Base Wing, by naming the new road after him. Colonel Growden died while on active duty at Kelly on June 26, 1954.

Construction on the runway complex progressed steadily throughout 1955. Work had progressed to such an extent that on December 10, five AT-6 trainers in transit from Missouri to Guatemala prematurely "christened" the new runway. Flown by Guatemalan officers with little or no knowledge of English, the AT-6s accidently landed on the open expanse of concrete, as the pilots ignored or misunderstood light signals from the control tower. The runway received no damage from this accidental use.

The official dedication occurred on March 16, 1956, as an F-102 touched down at Kelly for the first time. While the entire two-mile runway was not finished, there was enough space for the new fighter-interceptor to land. By the end of June, the contractor had completed the primary runway; most of the taxiways and aprons; and all runway, taxiway, threshold, and approach lights were in place. The new runway complex passed its final inspection on August 3 and went into immediate operation, marking an end to the years of grass landing fields and wooden hangars.

Kelly Grows Even Larger

By 1951 Kelly's existing storage lots and warehouses were filled to capacity, while new missions were making increasing demands on its overloaded facilities. Kelly desperately needed new warehouses. In planning for Kelly's fiscal year 1952 military construction program, base officials included construction of a $2 million, 480,000 square-foot depot supply warehouse and a $1.45 million warehouse, shop, and administrative space for the Directorate of Special Weapons. But before these facilities could be built, Kelly needed more land. In

1,564 acres of farm land adjacent to the existing base area. Not only did this price estimate prove completely unrealistic, but the Air Force ran into congressional skepticism over the need to acquire more land. Private citizens, concerned over what they perceived as a massive federal land "grab," prompted their congressmen to demand a thorough review of every construction project involving land acquisition. Kelly finally acquired 258.15 acres of land for $663 thousand in 1953. The land purchased ran west of Billy Mitchell Village and then north and west of the 1500 area warehouses.

In addition to the delay in acquiring the needed land, concern over construction of new warehouses also postponed construction. Headquarters Air Force launched an exhaustive study to determine the most efficient way to warehouse material and equipment, comparing new construction to renting storage space or contracting warehouse operations. Despite serious concern over building warehouses when commercial facilities were available, Kelly got the "green light" for both the new depot warehouse and the Special Weapons facility in 1954. Construction on Special Weapons building started in May 1954 and the depot warehouse the following September. All work was essentially complete on both facilities in the fall of 1955 when a new problem surfaced.

Both of the new buildings followed the specifications in a standard design called the "Standard AMC Depot Warehouse." Unfortunately, AMC learned the design was faulty when part of a facility at Gentile AFB, Ohio, built to that design collapsed. Investigation revealed a problem in the design. The supporting framework for the roof had to be strengthened by installing steel bands around the girders and then covering them with metal lath and plaster for fire proofing. The price for this work on Kelly came to $309 thousand for the warehouse and $152 thousand for the Special Weapons building, but no funds were available. Both directorates were in dire need for the space. In fact, the Directorate of Supply and Services needed the warehouse so badly that its personnel prematurely moved material into 10,000 square feet of the new facility. Finally, Headquarters Air Force allocated the funds. Contractors started work first on the supply warehouse, building 1534, in September 1956 and completed it on April 11, 1957. Work on the Special Weapons facility, building 1420, began a month later in October and was finished on July 27, 1957.

Acquisition of Kelly Annex Number 1

During the 1950s, as nuclear supremacy became the hallmark of American defense policy, the belief that World War III would be fought predominately by the Air Force dominated defense planning. Consequently, the 1950s was a decade of Air Force expansion and Army contraction, which meant the Air Force needed more storage space while the Army had surplus warehouses. Ever cost conscious, the Department of Defense decreed no more new warehouses would be built until all excess Army warehouses transferred to the Air Force.

As a result, negotiations began in August 1954 for SAAMA to assume responsibility for the San Antonio General Depot, a complex of Army warehouses located on Fort Sam Houston, approximately ten miles northeast of Kelly. This was Kelly's largest land acquisition since it absorbed Normoyle Ordnance Depot (East Kelly) during World War II. During negotiations, the name changed from the San Antonio General Depot to Kelly Annex Number 1, or KANNEX, which officially became part of Kelly on July 1, 1955, as the San Antonio Air Force Station. On April 10, 1960, the name KANNEX was dropped officially.

Acquisition of these facilities was significant in a number of ways. The oldest, continually active flying field in the Air Force assumed responsibility for one of the oldest Army depots in the United States; the

(From left to right) Lt Col John Eairley, new KANNEX boss; Col C. Jung, SAAMA's Director of Supply; and Lt Col Philip Melody, Army Commander, in the official transfer of the San Antonio General Depot from Army to Air Force control.

Army initially established the San Antonio General Depot in the Alamo on October 28, 1845.

The complex consisted of 256 acres, 154 buildings with 2.5 million square feet of covered storage space, railroad facilities, and 21.5 miles of paved streets. With the extra warehouses, San Antonio Air Materiel Area was able to remove all property stored in commercial warehouses and close out storage facilities on Pyote AFB, Texas, a Kelly subordinate installation in West Texas.

Kelly's Directorate of Supply and Services also became responsible for storage of household goods for a tri-state area and administered space allocated to Oklahoma City AMA for storage of B-47 and B-52 parts. Kelly storage operations at the San Antonio Air Force Station continued until 1981.

Kelly's Founder Returns

On March 1, 1955, retired Major General Benjamin D. Foulois returned to the site he selected almost forty years earlier as the home of a new aviation center south of San Antonio. Gone were the fields of cotton and small, wooden farm houses. In their place were fields of concrete and a huge industrial complex. Instead of fragile, linen-covered biplanes, massive aluminum-skinned B-36s dotted the ramps.

General Foulois, then President of the Air Force Historical Foundation, was the guest of honor at a luncheon sponsored by the San Antonio Military Historians Council, hosted by SAAMA Commander Major General Thetus C. Odom.

While much had changed at Kelly over the invervening years, the spirit with which early Kellyites maintained, repaired, and flew their aircraft is still very much a part of the ongoing Kelly tradition.

CHAPTER SIX

Logistics of the Cold War

By the middle of the 1950s, the San Antonio Air Materiel Area and the Air Force were well into a period of transition. To a large extent, the fundamental parameters of American strategy were set; deterrence, relying on the bombers of Strategic Air Command (SAC) was the foundation of American defense. But the emergence of new generations of jet aircraft and engines, along with the development of new methods of management, was already altering both the kind and quantity of the depot work load and its ways of operating.

None of these changes took place overnight. Although by the mid-1950s phase out of the huge B-36, the backbone of Strategic Air Command's bomber fleet since the end of the 1940s, was already underway, the giant plane would remain in service until the end of the decade. Likewise, repair and overhaul of the R4360 engines which powered the B-36 would remain an important part of the work load in Kelly's engine shops until 1964. Yet, at the same time, SAC also relied heavily on the all-jet B-47 and began taking deliveries of the B-52 "Stratofortress" in June 1955. For a time, at least, older and newer technologies served side-by-side in uneasy coexistence.

The Coming of the Jets

The B-47 prototype first flew in December 1947, making it a contemporary of such aircraft as the F-84, F-86, and F-89. Designed by Boeing, the B-47 was powered by six General Electric J47-25 engines, carried a three-man crew, and had a range of 4,000 miles. The first operational models began reaching Strategic Air Command units in October 1951.

Since the San Antonio Air Materiel Area was already deeply involved with the B-36 program, responsibility for the B-47 went to the depot at Oklahoma City. But in 1955, Oklahoma City asked San Antonio to assist in performing the regular depot maintenance on selected aircraft. Since mid-1953 the term for this regular depot overhaul was "Modification/Inspect and Repair as Necessary," or mod/IRAN, a shift in terminology which reflected a shift in Air Force maintenance practices from the earlier "disassemble, inspect, and repair" approach. With B-36 work loads shrinking, Kelly's maintenance officials were happy to tackle this new challenge of B-47 mod/IRAN, and promptly requested a typical

The Boeing B-47 was the first swept-wing all-jet bomber in the Air Force inventory.

B-47s under repair in Kelly's large maintenance hangar.

aircraft to use as a model in developing the procedures and costs for the kind of repair work involved. Unfortunately, SAAMA's maintenance personnel did not get such an aircraft until November 1955, by which time work on three of the first five aircraft scheduled for overhaul at Kelly was already underway. Indeed, the B-47 which did finally arrive was an early model whose configuration was not equivalent to the operational aircraft being repaired. It was useless for establishing standards for the overhaul of later model aircraft, so SAAMA personnel had to develop the necessary standards by trial-and-error while in the midst of the project.

The effort was, however, successful. By the end of 1955 SAC had accepted the standards established by Kelly personnel, and the overhaul of the first B-47s was on schedule. In 1956 San Antonio became a specialized repair facility for the B-47, ensuring a steady stream of the bombers into Kelly's repair shops.

Solving B-47 Repair Problems

When the B-47 first came to Kelly, it posed a series of new and complex problems for maintenance personnel. For one thing, Kelly had little experience with jet aircraft; although San Antonio was deeply involved in developing plans for the logistics support of the F-102 interceptor, the B-47 was the first jet aircraft to undergo maintenance and overhaul at the depot. In addition, the B-47 underwent a constant series of modifications during production; a situation compounded by the fact that production was divided among three manufacturers, Boeing, Lockheed, and Douglas. Each manufacturer built a different series of aircraft, and in many cases the modification kits were not interchangeable. Manufacturing delays hampered the delivery of some kits, too, with the result that occasionally aircraft had to be returned to earlier work stations on the repair line when kits finally arrived. Fundamentally, the difficulties arose from the speed at which modifications to the B-47 went into effect. The drive to get the plane into service, solve the problems which appeared, and improve later models, meant that in some cases modifications to modifications would appear even before an aircraft entered overhaul.

The complexities and intensity of the situation led to the formation of a B-47 mod/IRAN group with representatives from San Antonio, Oklahoma City, Boeing, Lockheed, and Douglas. Meeting at Wichita, Kansas (site of the Boeing plant), the group coordinated as much as possible the delivery of appropriate kits and served as a clearing-house for solutions to difficulties. Such ad hoc groups had long

been a way of dealing with large-scale problems, and the growing sophistication of Air Force weapon systems meant that similar groups would appear again in the future.

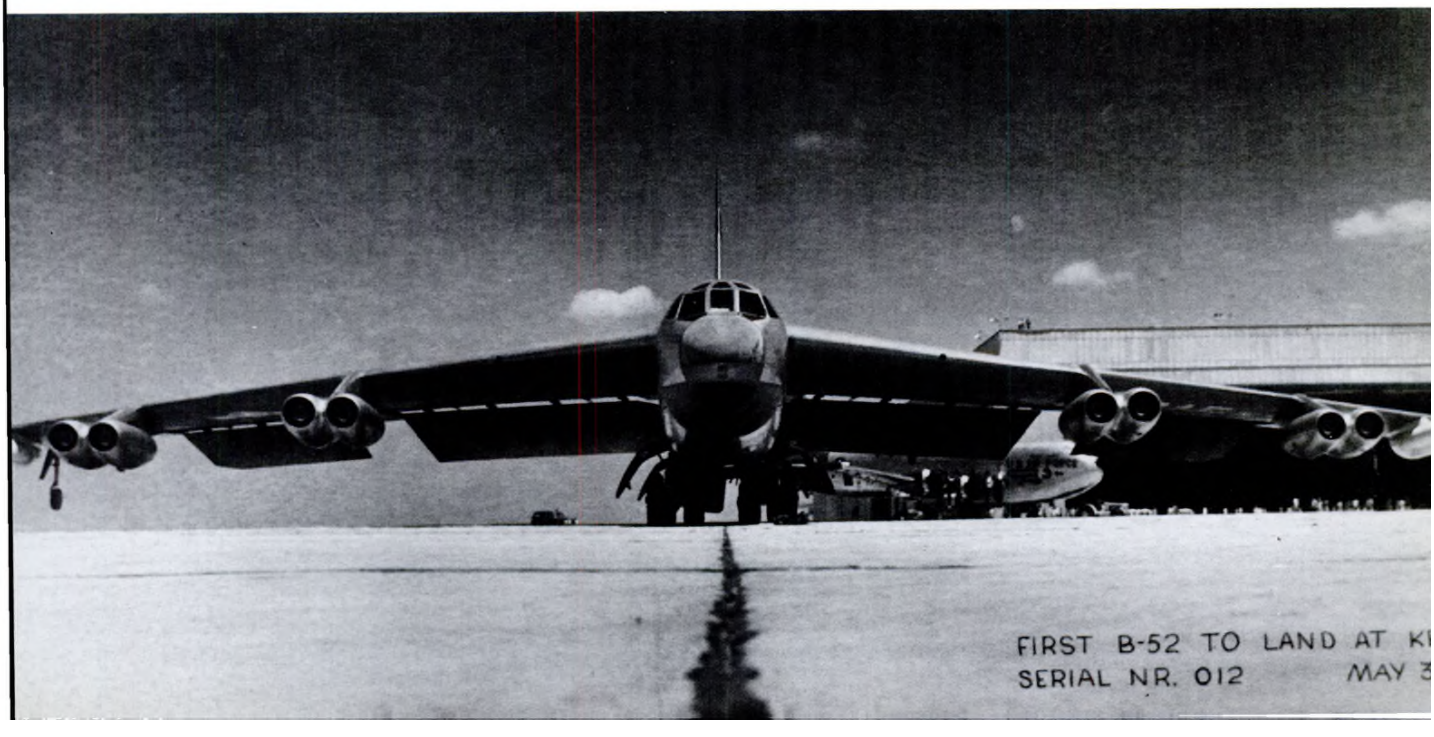

Although originally designed to accommodate the B-36, Kelly's brand new large maintenance hangar was first used to house the B-47 production line. Aircraft entered one end of the huge hangar, at the time the largest free-standing hangar in the world, and progressed along a series of stations. At each station maintenance crews carried out a specific modification or overhaul procedure, deliberately set up to avoid any interference with the work done at other stations. Indeed, as the maintenance teams grew more familiar with the work, and as the flow of necessary parts improved, the number of personnel required on the line was cut almost in half. Unfortunately, perhaps inevitably, just as the B-47s began to flow smoothly through the mod/IRAN process at Kelly, that portion of the SAAMA work load disappeared. Oklahoma City was still the prime depot for the B-47, and, after the completion of the fiscal year 1958 program in March, all future mod/IRAN and overhaul work returned there. But, even if the B-47 program at SAAMA was short-lived, it gave depot maintenance personnel invaluable experience in handling jet aircraft modification and overhaul--experience which was already paying dividends as Kelly's personnel dealt with the brand-new B-52.

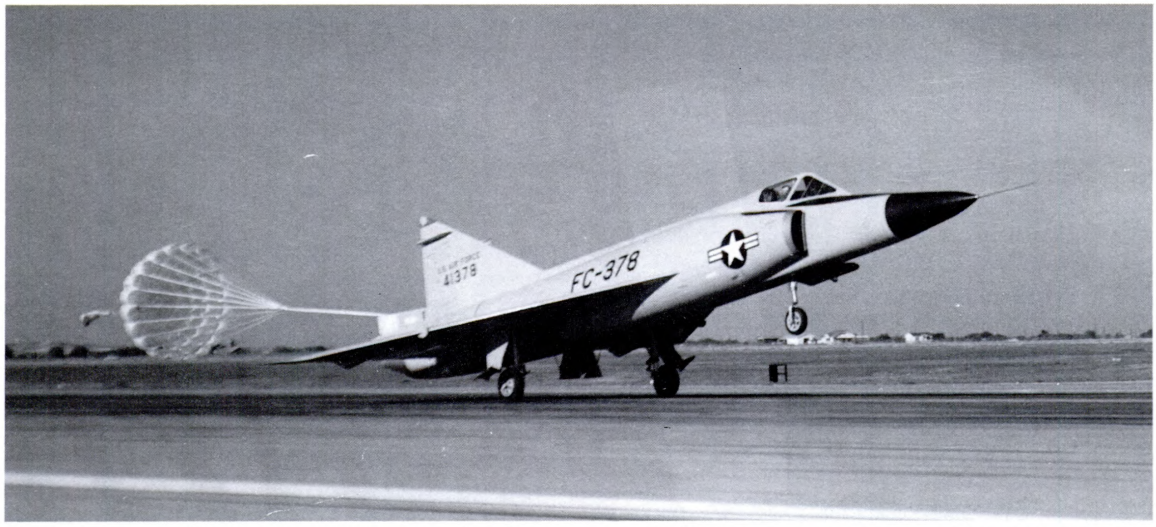

Early Years of B-52 Overhaul at Kelly

The B-52 "Stratofortress" prototype first flew in April 1952. Like the B-47, the B-52 was a Boeing design first proposed in 1945. Although jet bombers were already in development, the high fuel consumption of jets seemed to rule against their use in a long range bomber. Thus, initially the B-52, like the B-36, was to have powerful turboprop engines. By 1950, though, both the improvement in jet engine technology and the tension created by the Korean War led the Air Force to support a redesigned, long-range, jet powered B-52. Well aware of the problems which accompanied the hurried development of the B-47, the B-52 was viewed from the start as a complete weapons package. When the first production model B-52A flew in December 1954, test pilots and observers agreed that it was a superb aircraft. By mid-1955 the new plane was reaching Strategic Air Command wings, replacing the out-dated B-36 as quickly as production allowed.

Prime depot for the B-52 was, as in the case of the B-47, Oklahoma City. In 1952, however, the Air Force assigned specialized overhaul responsibility for the plane to SAAMA, with the Boeing factory in Wichita, Kansas, and Kelly the only sites for overhaul and repair. At the time no one knew that Kelly would still be working on the big bombers thirty-four years

The B-52 began entering the Air Force inventory in 1955.

The F-102 entered the inventory in 1956. This aircraft was used at SAAMA to prototype repair and modification processes.

later, but it was immediately evident that handling the maintenance chores for the aircraft would be a major task. Based on experience with both the B-47 and the C-124, SAAMA maintenance personnel developed a plan, outlining all the necessary steps to carry out B-52 mod/IRAN. A number of maintenance workers spent time at the Boeing plant, too, to become acquainted with the equipment and tooling needed. Others took part in training programs conducted at Kelly on the B-52's systems. Since one key modification was the installation and relocation of electronic countermeasure systems in the aircraft, work which required 2,600 man-hours to complete, training on the electrical system was especially extensive.

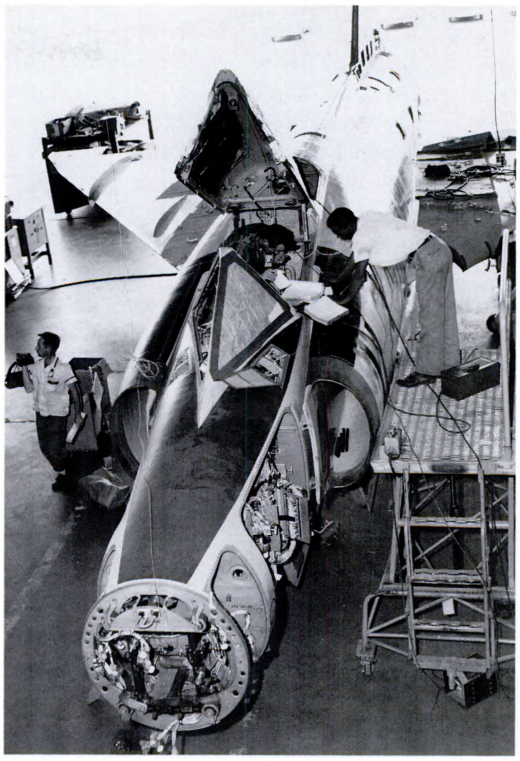

At least half the anticipated work on the B-52s coming into Kelly involved the sheet metal structure of the aircraft. To do this work properly, the plane had to be kept stable, held in place by jigs. The plane could not be moved from station to station like the B-47; workers had to move from plane to plane instead. As they had been during planning for the B-47, SAAMA's maintenance personnel were handicapped for several months by the lack of a suitable prototype aircraft on which they could test their procedures. Instead, they utilized the first aircraft to enter maintenance as a prototype. This plane entered work on May 31, 1956, and was finally ready for flight testing on March 19, 1957. By then, the mod/IRAN program was well underway.

The first B-52 scheduled for mod/IRAN at Kelly entered work in August 1956. Planners anticipated this aircraft would emerge 210 days later, but, in fact, the actual time amounted to 277 days--two months longer than forecast. Reasons for this were varied. The B-52 mod/IRAN program was far more complex than the B-47 program. Kelly workers had to modify the trailing edge of the wings to increase their load-bearing capacity and allow newer, and heavier, engines to be fitted. In addition, maintenance crews modified the leading edge de-icing system, added supports to strengthen the fuselage, modified the chaff dispensing system, altered the drag-angle, internally sealed the fuselage fuel tanks, and made extensive changes to the aircraft electrical systems and ejection mechanisms.

Overall, the complete mod/IRAN package required some 50,340 hours during the first half of 1957, and, considering that Kelly was still new at the B-52 overhaul business, some slippages in the schedule for the first few aircraft was not surprising. Nor did it help matters that delivery of necessary kits and technical data was sometimes late due to problems with the contractor. What mattered most was that, despite the problems, the B-52 program was essentially on-schedule by the fall of 1957. The man-hours spent completing each aircraft was falling steadily as workers grew familiar with what they had to do, and Strategic Air Command was fully satisfied with the aircraft it was getting from San Antonio. Although SAAMA's officials had no idea that Kelly would still be working on B-52s over thirty years later, they were more than pleased with the way the difficulties inherent in the mod/IRAN programs for both the B-47 and B-52 had been met.

The Delta Wing Fighters at Kelly

As Kelly's maintenance teams learned to cope with the mod/IRAN programs for the B-47 and B-52, they were also increasingly involved in similar efforts on behalf of the F-102 interceptor. The F-102 "Delta Dagger" was designed by Convair, the aircraft division of General Dynamics Corporation which also built the B-36. Conceived as a fast, bomber interceptor for Air Defense Command, the F-102 was powered by a single J57-P turbofan jet engine and had a top speed in excess of 825 miles-per-hour. It was the first "delta" wing aircraft built for the Air Force and was also the first fighter designed to carry only missiles and unguided rockets as armament. Although the first prototype flew in October 1953, it took further months of research and modification before the new aircraft met the performance criteria demanded by the Air Force. Along with the change to the J57 engine, designers lengthened the fuselage by seven feet, and modified the fuselage into a "coke bottle" shape. The Air Force did not commit itself to the purchase of the F-102 until early 1954, but by 1956 the first of a total of 875 F-102s were reaching flying squadrons. Eventually, thirty-two Air Defense Command squadrons flew the F-102. Some saw service in Vietnam during the late 1960s, and nineteen Air National Guard squadrons were still flying F-102s in early 1976.

Under the Cook-Craigie procurement plan, early models of the F-102 had to be modified into their final tactical configuration.

The Air Force bought the F-102 under a program of simultaneous procurement and development known as the Cook-Craigie plan after its sponsors, Major General Laurence C. Craigie, Deputy Chief of Staff for Development, and Major General Orval R. Cook, Deputy Chief of Staff for Materiel, during the late 1940s. The plan envisioned the use of the first thirty production aircraft as test models. Needed modifications would then be worked into the later production aircraft, with the first thirty modified to bring them up to standard. The purpose was to get vital weapon systems into production quickly, ironing out problems along the way as they appeared. It had the virtue of eliminating the time and cost of building and evaluating a series of prototypes, but it depended, as both generals admitted, on having a design that was essentially ready for production. When substantial changes had to be made, the costs rose dramatically, and this was certainly true in the case of the F-102. The modifications required after the testing of the first prototype in 1953 forced Convair to discard two-thirds of the tools already purchased for production, threw the production schedule into disarray, and complicated further the planning for depot maintenance and mod/IRAN of the aircraft.

From 1953 to 1957, Air Materiel Command negotiated five separate procurement contracts with Convair, all of which were administered by the San Antonio Air Materiel Area. Almost two-thirds of the aircraft were procured under the 1956 contract, with most actually coming off the Convair assembly line during 1957. Since the F-102 was conceived from the start as a complete system, logistical support was critical. San Antonio provided this support under the Weapons System Support Concept, a new management concept under which a single depot handled all aspects of support for a particular weapon system. The F-102 was the first weapon system supported under this concept (the codename for the pilot project was Delta Cover), and despite some problems Air Materiel Command decided in November 1955 to extend the idea to support all tactical aircraft. Although it represented something of a new direction in weapon system support, the idea that a single depot should control all the support for

a specific weapon system was actually the logical result of a trend already underway within Air Materiel Command since the early 1950s. Its impact would be felt even more strongly with future weapon systems, for which the San Antonio Air Materiel Area experience with the F-102 would prove a valuable guide.

SAAMA Support For the F-102

The original support plan developed for the F-102 was based on the premise that support for the flying squadrons would follow the familiar wing-base support concept. Air Defense Command objected to this, however, on the basis that the squadrons flying the F-102 would be deployed in ones and twos on bases around the globe. This type of deployment, required by the need to maintain an effective air defense over a wide area, together with the need to sustain the maximum possible readiness rate, required maintenance and support equipment be controlled by the squadron commanders. Procurement of necessary support equipment was already underway by the time a tentative table of equipment was approved in September 1956.

In theory, San Antonio supported the conversion of Air Defense Command squadrons from the F-86 to the F-102 (or the activation of a new F-102 squadron) by prepositioning equipment on each F-102 base sixty days before the first aircraft arrived, and by supplying technicians to each base thirty days before the aircraft arrived. These technicians would remain at the base for a further sixty days after the arrival of the new aircraft to assist in performing field modifications and training local maintenance personnel. In practice, it proved exceedingly difficult to preposition equipment the way planners envisioned. Although Air Defense Command was supposed to notify SAAMA 180 days before the arrival of F-102s at a new location, San Antonio often got word with far less time than this to prepare. In addition, the only time equipment was even ready for prepositioning was when Convair was ahead of schedule in delivering ground support equipment or spares. Convair was not, in fact, required to deliver any of this materiel ahead of time and usually did not. The fact that the F-102 was constantly being modified simply added to the difficulty of procuring appropriate equipment ahead of time. Nevertheless, by the end of 1957, SAAMA had managed to preposition spares at thirteen Air Defense Command bases.

The 182nd Fighter Interceptor Squadron at Kelly was the first Air National Guard unit equipped with the F-102.

F-102s undergoing mod/IRAN at Kelly.

F-102 Mod/IRAN Programs

Under the procurement plan for the F-102, the first fourteen aircraft were to remain in the test program while the next eighteen aircraft would eventually be modified to match a standard configuration--theoretically established with the thirty-third aircraft produced. In this event, even a tentatively firm configuration was not reached until the 354th aircraft on the line, delivered in May 1957. Modifying the aircraft even to this tentative standard (which did not include the electrical automatic attack and landing systems) involved the incorporation of twenty-two engineering change proposals along with the installation of the electronic attack and landing system components. Although Convair hoped to handle the entire work load at its Fort Worth, Texas, facility, Air Materiel Command opted to have the load spread over four depots as well. Complicating this decision was the fact that spares and tooling existed for a maximum of three sites, not five. It was also virtually impossible to determine the proper mix of parts to order, since by now there had been 629 engineering change proposals, seventy-two technical order modifications, and 31,000 design changes during production. Every F-102 was in some way unique, and the depots had to stock an enormous variety of items.

Despite these handicaps, by the end of 1958 the F-102 mod/IRAN effort was largely back on track. Kelly's maintenance teams completed sixty-three aircraft, more than any other single facility, and only three short of the two year program goal at SAAMA. At the same time, SAAMA officials were working behind the scene to shift the responsibility for both F-102 depot overhaul and component repair to the Mobile Air Materiel Area in 1961 enabling Kelly to handle more efficiently the depot overhaul of other aircraft.

The San Antonio Air Materiel Area overhauled its last F-102 as a specialized repair activity in October 1960. It was the 505th F-102 to pass through Kelly's shops, and over the previous four-and-a-half years SAAMA's maintenance and management specialists had contributed enormously to the aircraft's ultimate success as a weapon system. The difficulties were enormous. Constant modifications to the F-102 throughout production placed unusually heavy strains on the aircraft maintenance program. At one point, essentially brand-new aircraft were entering mod/IRAN, far ahead of any need based on actual deterioration. The only justification was the paramount need to upgrade these aircraft to the most recent configuration, a standard that in fact changed several times over the production run. During 1957 and 1958, SAAMA officials estimated that upwards

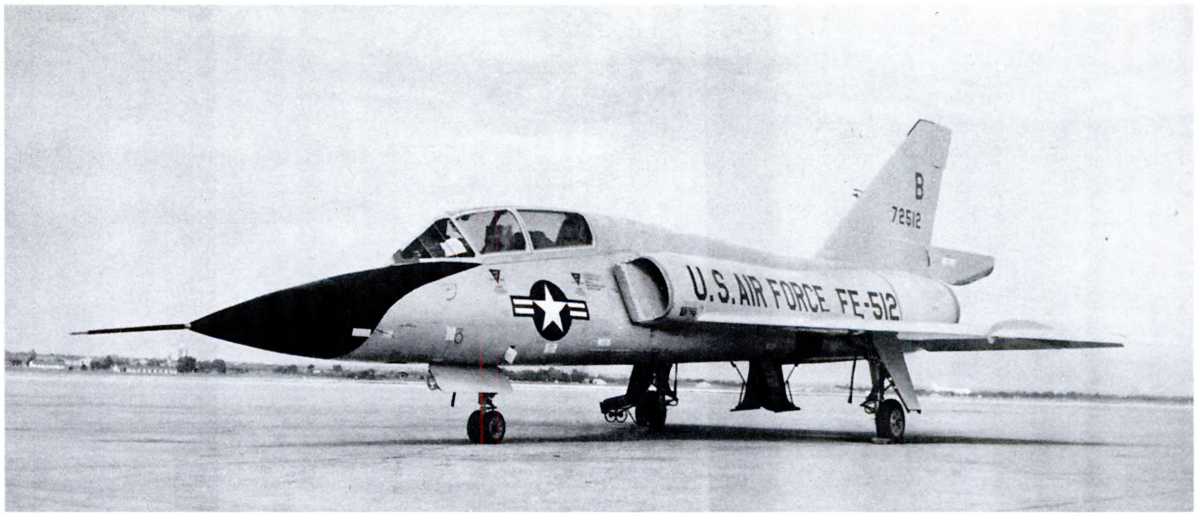

of eighty-five percent of the mod/IRAN effort was devoted to modification rather than repair. Indeed, at times the modification process was so extensive that SAAMA's maintenance teams were rebuilding essentially the aircraft from scratch. Monetarily this was expensive, and the cost was increased by the need to rely on Convair for development of most major modifications and for much of the technical data.

But there were valuable lessons to be learned, too, particularly the need to develop accurate work specifications from the start. And, SAAMA's workers could take pride in the high degree of effectiveness and efficiency they reached in handling what was admitted widely as a difficult program. The F-102 went through four separate maintenance/overhaul programs at Kelly, with SAAMA also overseeing the contract team maintenance program. And, in accomplishing the airlift and wing repair program, SAAMA helped save millions of dollars. This was an important success, and testifies to the effort made at Kelly on behalf of the F-102. Despite the problems, SAAMA did well.

Even after the Mobile Air Materiel Area began handling the depot overhaul and mod/IRAN of the F-102, specialists at Kelly continued to manage the aircraft through the end of its service life and beyond. As the F-102 disappeared from the active inventory in the early 1970s (only two Air Defense Command squadrons still flew it by 1971, even though nineteen Air National Guard squadrons were equipped with it), SAAMA took on the task of logistically supporting the conversion of up to 150 Delta Daggers into remotely controlled targets. The project, managed by Air Force Systems Command, was nicknamed Pave Deuce, and by 1974 eight aircraft had been modified. Three could still be flown by a pilot aboard the plane; the others were flown solely by remote control. Even before testing was complete, the Air Force enlarged the program to 132 aircraft for Air Force use and seven for the Army (as targets for ground-to-air missiles then in development). By the end of 1977, sixty-nine aircraft had been modified, with twenty-four either used as targets or destroyed in crashes. Overall, both the Air Force and the Army were pleased with the program, which provided a reasonably economical, full-size, supersonic, manuevering target. During the early 1980s, the Air Force contemplated converting the remaining F-102s stored at Davis-Monthan Air Force Base in Arizona, but opted to convert retiring F-106s instead.

Kelly stopped handling F-102 mod/IRAN in 1961.

On October 24, 1958, this two-seat F-106B became the first F-106 to touchdown at Kelly.

The F-106

The F-106 "Delta Dart" began as an improved model of the F-102 in 1955. It was, in fact, originally designated the F-102B. Powered by a J75 engine with fifty percent more thrust than the J57 of the F-102, it first flew in December 1956. By then, the Air Force was committed already to production under the Cook-Craigie procurement plan. Deliveries to Air Defense Command squadrons began in July 1959, and ultimately, the Air Force bought 341 aircraft under four production contracts, the last three of which were highly controversial fixed-price-incentive-fee contracts. Procurement officials hoped that these contracts would lead to a higher quality product for less money, but in fact the sliding scale of profit allowed under these contracts resulted in far higher costs. Moreover, the F-106 was developed before all the problems with the F-102 were solved. Like its predecessor, the F-106 underwent almost constant modification. Getting it from "the drawing board to the sky," wrote SAAMA historian Jesse Scott in 1960, "proved a hard and hazardous task."

As the logistic support manager for the F-106, SAAMA was involved in the program from the start. San Antonio personnel computed the requirements for support equipment, budgeted for parts and repair, stocked and supplied parts to other repair locations, and oversaw everything from procurement through modification and repair of the aircraft. Considering that procurement, testing, manufacture, and modification were going on simultaneously, this was a tall order, and in many ways the story of the F-106 echoes that of the F-102. Both programs suffered from a large number of design changes during production which made it difficult to stockpile the appropriate spares; neither produced an aircraft with which the Air Force was particularly pleased.

San Antonio's main effort on behalf of the F-106 involved management, not repair. In the beginning the contractor did most of this work. Indeed, even before agreeing to accept the first five production F-106As or the first three F-106B (two-seat) test aircraft, Air Defense Command requested an upgrade. The upgrade included nine engineering change proposals along with installation of a more powerful engine, and all the changes were incorporated into subsequent production models. At the same time, the Air Force decided to modify the test aircraft to the existing tactical configuration. This program, known as "Test-to-Tact," was developed by SAAMA engineers but carried out by Convair. Unfortunately, even though money was provided to fund part of the modification program, the program itself was not approved until three months after the deadline to begin the acquisition of parts kits. In the meantime, the contractor for the automatic weapon control system, Hughes Aircraft Company of California, increased its lead-time requirements, increasing the total cost by nearly forty percent. Air Materiel Command eventually provided the funds, and the program began in Janaury 1960.

However, at the same time that the "Test-to-Tact" program was underway, a series of additional modification programs also began. One, called "Wild Goose," was intended to reduce the number of

fire control configurations from seven to two. Another, "Broad Jump," was carried out by the Sacramento Air Materiel Area (designated as the site for depot overhaul and mod/IRAN in 1959). A fourth modification program, "Dart Board," was to carry out urgent modifications, ignoring all maintenance work or less urgent modification. With all four programs underway during 1961, parts provisioning became a nightmare. Numerous problems with F-106 subsystems continued to surface; Convair complained bitterly about alleged shortages of government furnished equipment; Air Defense Command was disenchanted increasingly with the aircraft.

Survivability Issues

When the F-106 first entered production, it seemed possible that it would be the last manned interceptor; the future seemed to belong to missiles and spacecraft. By 1962, if that notion had not entirely disappeared, it was certainly less dominant. For the foreseeable future at least, the Air Force would have to rely on a manned interceptor. While the F-102 would remain in the inventory, it was not the aircraft to fill the bill. That left the F-106 as the only available aircraft to carry out air defense until the early 1970s. The result was the Interceptor Improvement Program intended to provide Air Defense Command aircraft with the ability to fight and survive in an environment of increased reliance on electronics. At the same time, Air Defense Command criticisms of the F-106, especially incomplete testing, led to a Service-Revealed Deficiency Test Program, run by SAAMA at Holloman Air Force Base, New Mexico.

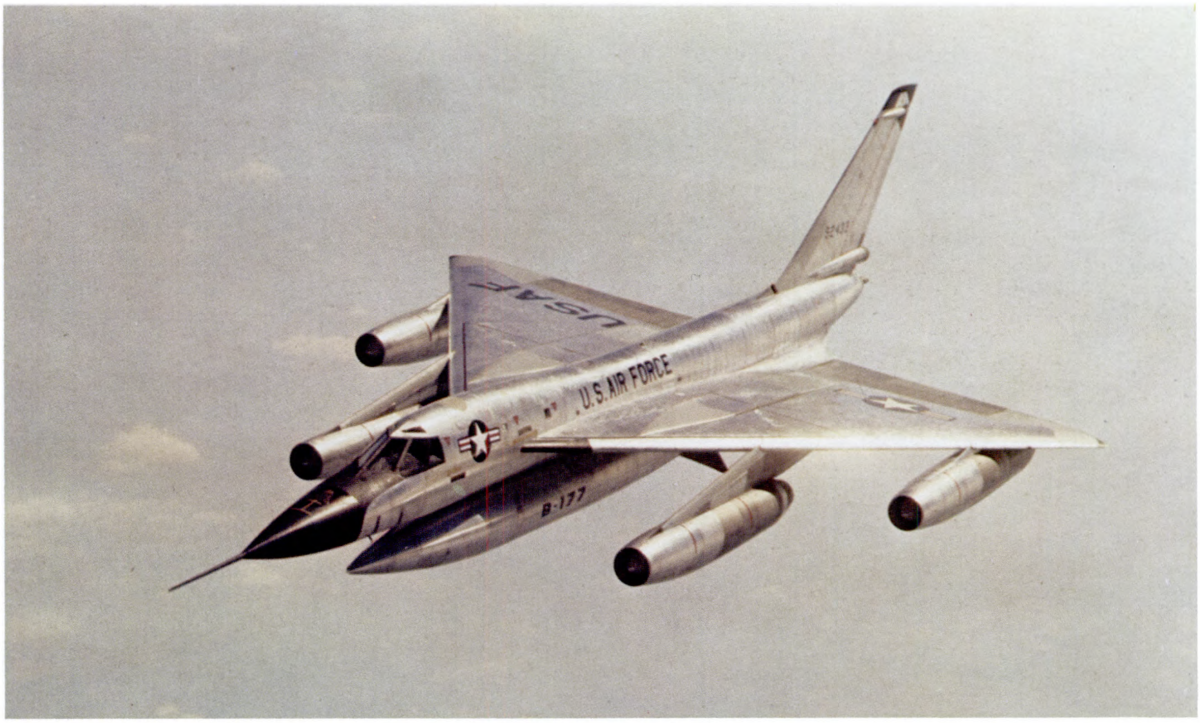

The Interceptor Improvement Program actually consisted of five major improvement modifications and six less complicated retrofit modifications. Five of the major modifications, and all of the retrofits, applied to F-106s, and included installation of infrared sensors, parametric amplifiers, new antennas, and electronic countermeasure devices. Kelly was responsible for ensuring the funding of these programs and handled the task of coordinating the activities of all the involved agencies through quarterly meetings. Tests of modified F-106As began in January 1961, with final approval to go ahead with fleet-wide modifications in November. San Antonio personnel immediately initiated the purchase of the needed kits, and Sacramento handled the depot modification work.

Most of these modifications were complete by 1963, although improvements to the F-106 continued, largely on the basis of results of testing done in the Deficiency Test Program. Among the changes which came from this effort was the installation of a supersonic ejection seat. The program, managed by SAAMA, continued under contract with General Dynamics as the Service Engineering Test Program at Holloman until 1970. Among the last major modifications to the F-106 was the addition of air-to-air refueling recepticles in 1968, but there were continuous upgrades of the electronic systems. Improvements like this allowed the F-106 to continue to serve into the 1970s, although the number of aircraft in the active inventory declined rapidly after 1972. Eleven active squadrons flew the plane in 1972; six in 1974, along with six Air National Guard squadrons. In the mid-1980s, three air divisions of Tactical Air Command, and four national guard squadrons still flew F-106s, with the last Delta Dart leaving the inventory in 1988. Like the F-102 before it, the remaining F-106s were programmed to serve as remote controlled target drones.

The Hustler

The initial requirement for what would become the B-58 bomber came from General Curtis LeMay, commander of Strategic Air Command, in 1947. At that time, designers saw the future bomber as a refinement of the B-36. No jet powered bomber, given the state of jet engine development in the late 1940s, could meet the Air Force requirement for a heavy bomber with a combat radius of 2,500 miles. By 1951, however, improvements in jet engine technology were leading Convair engineers toward the design of an all-jet, supersonic bomber. In competition with Convair, Boeing also developed a bomber design (distinct from the B-52 which was being built), but in the fall of 1952 the Air Force opted for the Convair aircraft--already nicknamed the "Hustler."

Like the F-102, which was under development, and the later F-106, the Air Force bought the B-58 under the Cook-Craigie concept. The normal practice of building a prototype and testing it to see what flaws existed was expensive and took time, both in short supply in 1952. The procurement of the B-58 did,

The B-58 Supersonic Bomber

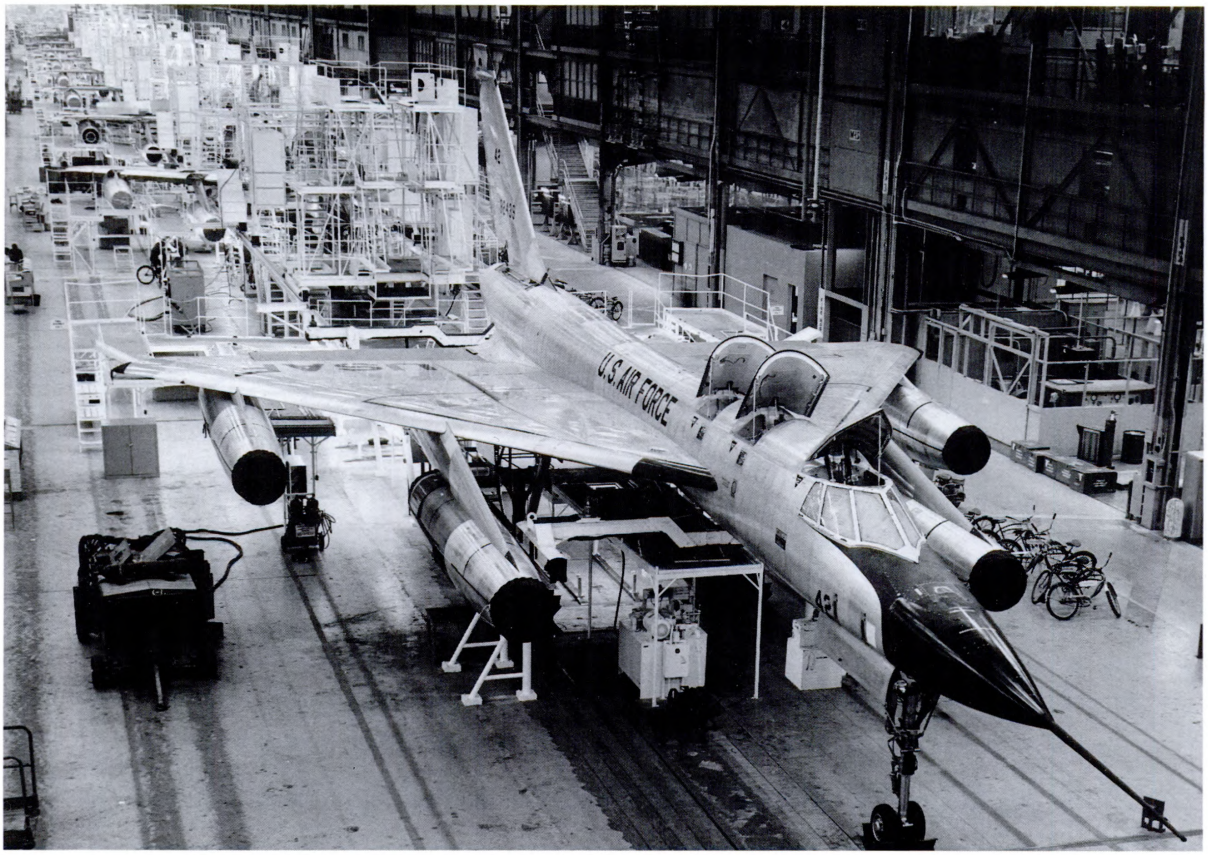

however, differ slightly from that of the F-102. While the contract for the F-102 combined production, research, and development, the contract for the B-58 was for thirty test aircraft.

By delaying full production until the end of testing, the Air Force undoubtedly hoped to avoid many of the problems encountered in the F-102. In addition, there was still debate over the need for the B-58; during most of the early period of the aircraft's development, Strategic Air Command and General LeMay argued that the B-58 was not needed. Unhappily, this hope was not realized. Like the other Convair delta-winged aircraft programs, the B-58 ran into numerous problems, attributable to both the daring novelty of their design and the speed with which new, untried technology went from design to production. Indeed, Convair was still in the process of developing a firm design configuration when the Air Force agreed to buy the B-58. Three further design configurations of the aircraft appeared before Convair and the Air Force settled on a final one in September 1954.

As it finally emerged, the B-58 was a delta winged aircraft, just under ninety-seven feet long, with a wingspan of just under fifty-seven feet. Four General Electric J79 turbofan engines powered the bomber, which had a top speed over 1,380 miles-per-hour and carried a three-man crew. In contrast to other current bombers, which carried their bomb load in an internal bomb bay, the B-58 carried its load in a specially designed pod slung below the fuselage. The pod could carry either nuclear weapons or electronic countermeasure devices to assist other bombers in penetrating enemy defenses. Production was finally approved in 1955, and the first B-58 prototype flew in November 1956. The first operational models began reaching the 43rd Bomb Wing at Carswell Air Force Base, Texas, in August 1960, although the wing did not have its full complement of aircraft until May 1961. At that time, the 305th Bomb Wing at Bunker Hill Air Force Base, Indiana, began receiving its first B-58s. Ultimately, the Air Force purchased 116 B-58s, but only the 43rd and 305th Bomb Wings were equipped with them.

SAAMA and the B-58: Early Involvement

San Antonio's involvement with the B-58 officially began in March 1955, when SAAMA was designated the "lead" air materiel area for the new plane, acquiring both prime and specialized repair responsibility

B-58s progress along the assembly line at Convair's Fort Worth, Texas, factory.

at the same time. Under the weapon system concept, an attempt to streamline procurement and simplify management by giving a single manager the responsibility for all the component systems and subsystems of a new weapon, Air Research and Development Command (ARDC)--the forerunner of Air Force Systems Command-- worked in partnership with Air Materiel Command during the early stages of development. While Air Research and Development Command retained the responsiblity for developing design criteria and overseeing the testing, AMC handled management of contracts, developed maintenance specifications, and coordinated with ARDC on the testing. As the lead AMA, San Antonio took on these responsibilities, with one of the first steps being the creation of a logistics support plan for the test phase of the B-58 program, codenamed Project White Horse. By early 1956, SAAMA also had a full-time representative at the Convair plant in Fort Worth, Texas, and had created a B-58 Control Group to coordinate supply, procurement, and maintenance activities at Kelly.

Under the weapon system concept as it applied to the B-58, Convair handled design and engineering tasks, and dealt directly with subcontractors in acquiring major components. Thus, the Air Force had to provide a minimum of equipment and its role became largely one of monitoring Convair's plans and progress--and supplying the money. Much of Kelly's effort in the early stages revolved around developing estimates of the quantities of material needed, and the cost of that material, through negotiations with Convair.

Instead of spreading the test program among several bases, it proved more economical for Convair to conduct the testing at their Fort Worth facility adjacent to Carswell Air Force Base. Phase I of the test program began in November 1956, and revealed a number of problems. Malfunctions in the fuel system impaired the B-58s stability; afterburner problems resulted in yawing at high speeds; the prototype engines vibrated excessively, exacerbating acoustical and sonic fatigue of the fuselage and contributing to the appearance of cracks along rivet lines

on the forward section; the brake system failed to perform adequately, leading to frequent tire failures; and the ejection system was unsafe at high speed. More ominous were problems with the bombing and navigation system under development by the Sperry Gyroscope Company. Indeed, the number of problems uncovered during flight testing led the Air Force to consider cancelling the B-58 in 1958 and early 1959, but it eventually decided simply to limit procurement to the aircraft for two wings, no more.

Early Modification Programs

At the time the B-58 was entering the inventory, Air Force leaders believed that maintenance work loads should be handled as much as possible by the air materiel areas. Contract maintenance was to be used only when work loads exceeded the capacity of existing Air Force operated facilities or if the repair of some complex items required unique and expensive equipment which no Air Force facility possessed. During 1958 SAAMA officials--working with people from several other AMAs, Convair, and Convair's subcontractors--conducted a "Best Mix" study to determine the most economical and efficient assignment of B-58 repair and overhaul tasks. The resulting plan, approved by Air Materiel Command in June 1959, identified twenty-nine specialized repair activity assignments, ranging from the overall aircraft structure to subsystems such as the oxygen system and drogue parachute braking system. Responsibility for twenty-three of these assignments went to SAAMA, although by 1961 Kelly still lacked organic capability for seven of them.

Training occupied SAAMA's Directorate of Maintenance during the final months of 1959 and all of 1960. In March, SAAMA obtained the first production B-58 to serve as a testbed for maintenance procedures. Kelly was ready by 1962, but ironically Strategic Air Command decided it could not spare the aircraft for the length of time involved in repairing or modifying them at a depot. Kelly's

Hustlers undergoing modification during the early 1960s.

maintenance teams thus traveled to the aircraft to perform modifications. B-58s did not actually enter maintenance shops at Kelly until late 1962, when SAAMA, in conjuction with Convair, began a major modification program called "Hustle-Up." This project involved modifying the fleet of test aircraft to the tactical configuration through the installation of multi-weapon carrying capacity and an improved ejection system. San Antonio's share of the work load amounted to thirty-six of the fifty-six aircraft modified in the first phase and twenty-six of the thirty-six aircraft modified in the second phase. Not surprisingly, given both a lighter work load and greater experience with the B-58, Convair finished its portion of the Hustle-Up project quickly. Kelly had trouble at first, mainly due to incorrect interpretation of engineer drawings and the acceptance of incorrect modification kits, but rapidly caught up. By the end of the program in May 1964, sixty-four aircraft had passed through maintenance for one modification or another.

Management Support Efforts

Beginning in late 1961, Strategic Air Command complaints about the logistical support of the B-58 brought about a SAAMA-developed program called "Pull-Out," intended to eliminate a shortage of parts at B-58 bases. Under a contract awarded in April 1962, General Dynamics (the parent company of Convair) began producing increased numbers of modification kits and other spare parts. Inventory managers monitored supply levels constantly in an effort to maintain adequate stocks in the field. The effort was intense, yet recovery was slow. Initially expected to run only six months, Pull-Out actually continued until the end of 1963, by which time support had improved dramatically.

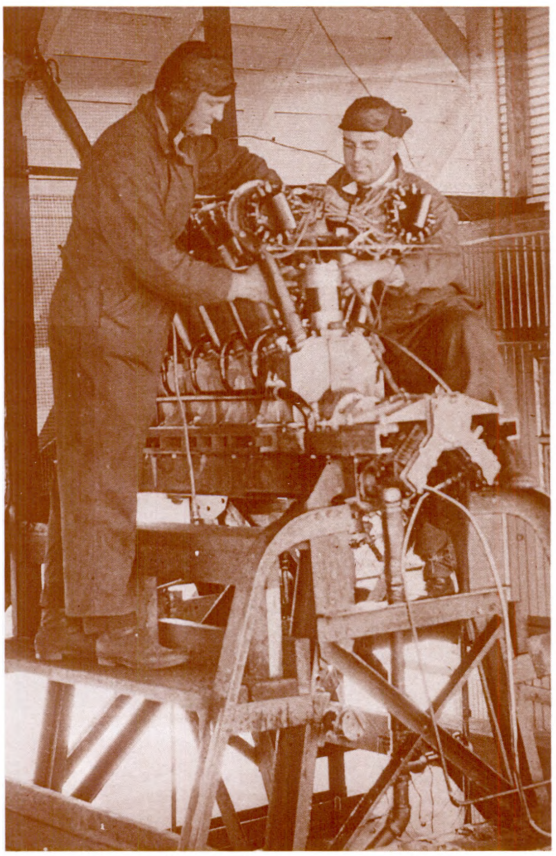

Later Maintenance Programs and Phase Out

In 1965 and 1966 only a handful of B-58s entered maintenance facilities at Kelly. General Dynamics continued to perform most of the modification and overhaul work at its Fort Worth plant. From the start, SAAMA planners estimated that B-58 depot overhaul or mod/IRAN would begin about 1966, but by 1965 routine inspections uncovered a number of critical problems. Plumbing and wiring on many of the bombers was deteriorating rapidly, and numerous aircraft had visible evidence of metal fatigue and corrosion. Kelly maintenance officials urged an immediate start to depot repairs, and in early 1966 B-58s of the 43rd Bomb Wing began entering a comprehensive mod/IRAN program at Fort Worth and later at James Connally Air Force Base outside Waco, Texas. However, even as this repair effort got underway, Secretary of Defense Robert S. McNamara announced that the B-58 would leave the active inventory by mid-1970. The bomb and navigation system was still not operating reliably, and improvements suggested by various contractors carried price tags that were far too high. Strategic Air Command protested briefly, hoping to preserve the size of its manned bomber fleet, but, once it began, the retirement of the B-58 went faster than scheduled. The last two B-58s of the 305th Bomb Wing flew to Davis-Monthan Air Force Base, Arizona, in January 1970.

An Engine Depot

Ever since the establishment of the San Antonio Air Intermediate Depot in 1921, a hefty proportion of Kelly's overhaul effort had been engines. In the beginning, most of these engines were Curtiss OX varients used in the "Jenny" trainers or Liberty engines, which powered the DH-4s and Martin MB-2s flown by the border patrol squadrons. By the early 1930s, the Duncan Field engine shops handled engines like the V1150 of the Curtiss P-1 "Hawk" and the Pratt and Whitney R1340 of the nimble Boeing P-12 biplane fighter. This was the first Pratt and Whitney engine used by the Air Corps, beginning a relationship between Pratt and Whitney, the Air Force, and Kelly which has continued to the present.

The engine work load expanded enormously during World War II. At one time or another, nearly every type of aircraft in the inventory passed through the Duncan Field maintenance shops--and so did the engines which powered them. Engine specialists already were familiar with the Pratt and Whitney R1830 of the P-36. Four of the same engine powered the B-24 Liberator, while two served as the powerplants for the C-47. By 1945, though, the heaviest engine load at Kelly (reunited with Duncan Field in 1943) consisted of the R3350, powerplant of the B-29, and the R2000 engine of the C-54 transport. Kelly became the primary overhaul site for B-29s

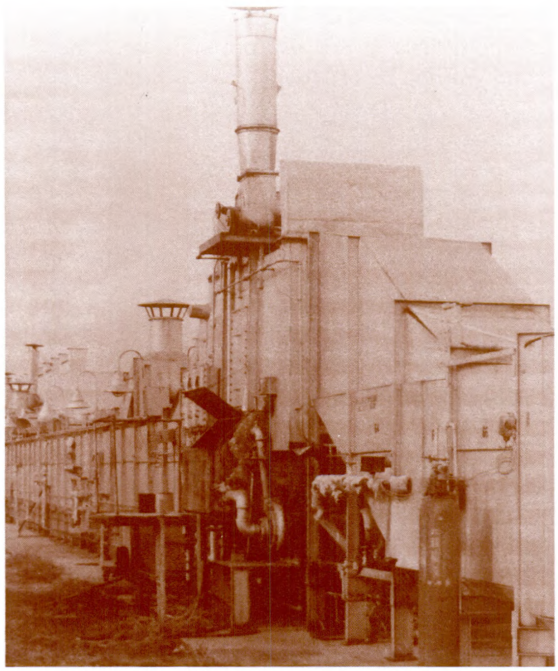

A pair of civilian mechanics work on a Liberty engine in a Duncan Field outdoor test cell during the 1920s.

bound for the Pacific in July 1945 and, by operating the test blocks around the clock, seven-days-a-week, turned out 450 engines a month.

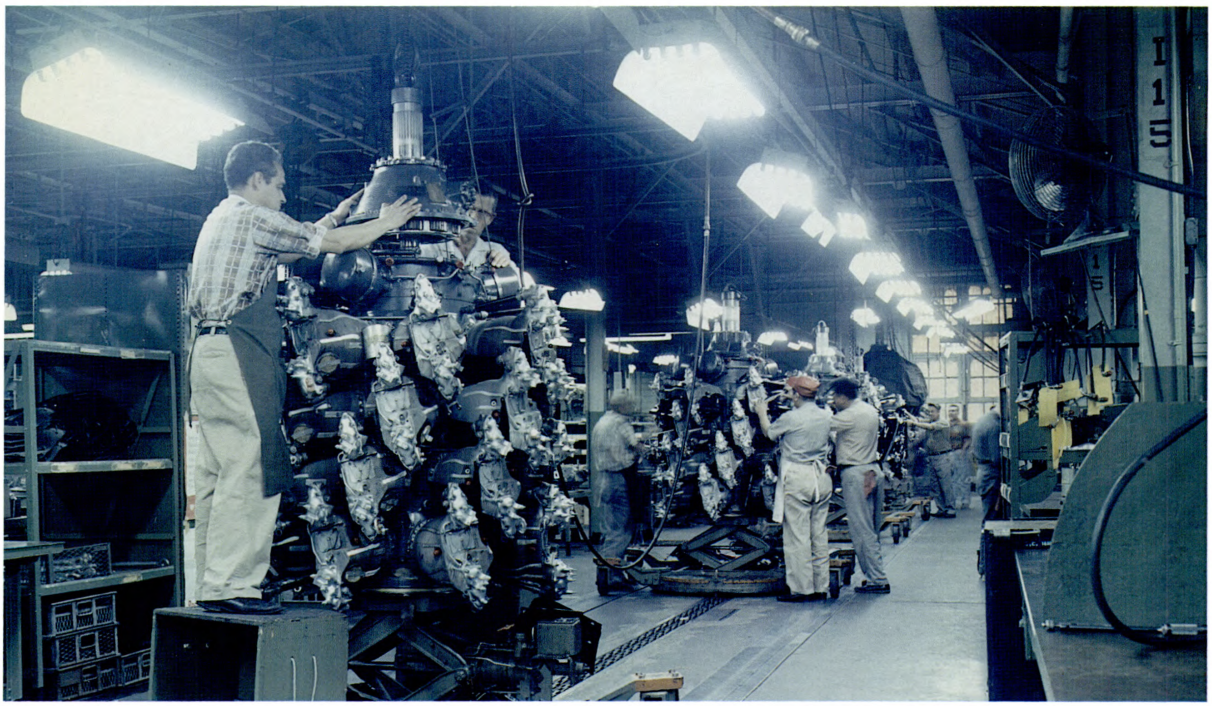

Engines in the Postwar Years

The end of the war brought an immediate cutback in work loads of all types at Kelly, including engines. Most of the effort which continued was in support of the R2000 engine of the C-54, with a proportion of the necessary equipment coming from the Ogden Air Technical Service Command. Briefly delayed by budgetary restrictions, Kelly engineers installed a monoveyor system in 1946 which carried engines through a series of disassembly stations. At each station along the 2,150 foot stretch of the monoveyor engine workers disassembled specific portions of the engine, placing smaller parts in baskets and hanging larger parts on hooks so they traveled along with the engine. All the parts were identified with metal tags. Near the end of this process, the disassembled engine (together with all its component parts) traveled through 643 feet of solvent baths and rinses which stripped off grease and dirt. After this, the engines were inspected, condemned parts removed, and the remainder went into rework and reassembly.

Use of the monoveyor immediately speeded up engine overhaul from fifty to seventy-five engines per eight-hour shift. One problem, however, was that the solvents not only took the grease off the engines, they took it off the moving parts of the monoveyor, too. Until Kelly engineers could develop an automatic lubricating system, workers had to manually grease the monoveyor wheels as they emerged from the solvent bath. A second problem was unforeseen at the time. The monoveyor was in operation until the 1970s, by which time it was better known as the "Green Worm," and over the years it spilled thousands of gallons of solvents and other residue on the ground. A later generation, more conscious of the environmental impact of maintenance operations, would be left with the task of cleaning up the decades of spill. This was an unwanted side-effect and an expensive legacy.

The "Green Worm" engine part cleaning monoveyor speeded up engine repair, but at an environmental cost.

Overhaul of the R4360 "Wasp Major" was a Kelly mission throughout the 1950s. The rows of cylinders are clearly visible in this photograph.

R4360

By the time the monoveyor was running, Kelly's engine facilities were also preparing to handle the depot overhaul of the R4360 engines, which powered the B-36 and its unique transport cousin, the XC-99. Nicknamed the "Wasp Major," the R4360 was a huge engine--four rows of seven cylinders, staggered just enough to allow cooling air to flow from front to rear, capable of 3,000 horsepower. Designed in the early 1940s, the R4360 was reliable in the air, but its complexity made it difficult to deal with on the ground. The shutdown procedure for engines on the B-36 took six hours; start-up took four. Troubleshooting was equally time-consuming. Bendix, for example, developed an engine analyzer which could check nearly every aspect of a running engine, but using it on the R4360 involved connecting fifty-six wires per engine for the spark plugs alone. It was one of the few engines which could be shutdown in perfect condition and have problems the next time it was started.

Despite these shortcomings, its virtues of power and low torque led to the use of the R4360 on several Air Force aircraft. They were installed on a variant of the B-29 called the B-50 and served for years as the powerplant of the Douglas C-124 Globemaster. There was no shortage of engines needing overhaul, and throughout the 1950s and into the 1960s it made up the lion's share of Kelly's engine work load. It also forced a major facility construction effort, including complete modification of test cells. Among other changes, special ramps and dollies had to be constructed to hold the big engine in a vertical position during testing.

From Operation Vittles to First Jet Engines

Overhaul of R4360 engines was just beginning when, in June 1948, the Soviet Union halted overland travel into the jointly occupied city of Berlin. In response, at the immediate order of President Harry S. Truman, the Western Allies began an airlift of vital supplies into the isolated city. Known simply as the Berlin Airlift, nearly every available transport quickly was included in the around-the-clock shuttle. This included veteran cargo haulers like the C-47, along with five C-82s, a single C-74, and a lone C-97. But the backbone of the American airlift fleet was the

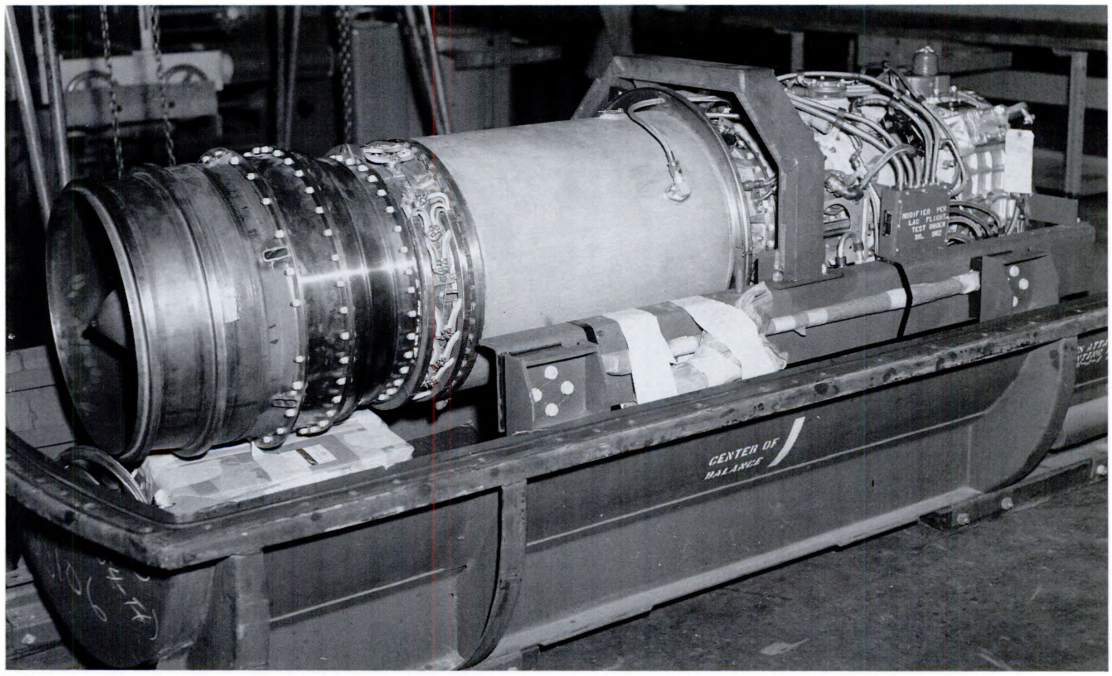

C-54 (known as the R-5 by the U. S. Navy, which supplied two squadrons to the airlift). Flying day-and-night, the strain on the R2000 engines which powered the C-54s was enormous. To meet the demand, Kelly's engine shops doubled production of R2000 engines, using two shifts for a time and working seven days a week. Even when the Soviets lifted the blockade in May 1949, the airlift continued, with the last C-54 coming into Berlin on September 30. It was an unprecedented achievement, and Kelly's contribution was even more remarkable considering that the number of R4360 engines coming off the overhaul line also doubled.

Kelly engineers also pioneered the storage and shipping of engines with the development of pressurized containers, used instead of wooden packing crates. This new process, introduced in July 1949, eliminated the need to inspect packed engines every month. Initially used for the R4360, containers were soon used for all engines. Engineers also found a low dust alternative to the usual abrasives used in air-blasting engine parts: crushed pecan shells. It was an effective process, too, however odd it seemed at first. Kelly's overhaul of the R4360 ended in March 1964, but the big engine remained a management responsibility well into the 1970s.

The First Turboprops

By 1953 it was clear that jet engines represented the future in terms of aircraft propulsion. Even though Kelly's engine shops were still concentrating on the R4360, other reciprocating engines were beginning to disappear. In July 1953, for example, overhaul of R2000 engines was turned over to a commerical contractor, the Spartan Aircraft Company of Tulsa, Oklahoma (which, after briefly losing the contract to an Oakland, California, firm, was still overhauling the engine in the 1960s). A month later, Air Materiel Command designated Kelly as a minor repair activity for a series of jet engines: the General Electric J33 used in the F-80; the Allison J35 used in the F-84B and F-89; the General Electric J47 used in the B-45 (the first four-jet U. S. bomber), the F-86 "Sabrejet," and the B-47; the Pratt and Whitney J48 used in the F-94; the General Electric J57 used in the B-52; and the imported Curtiss-Wright J65 used in the F-89F. For some time, though, Kelly's role in handling these engines was limited to testing, minor repairs, and management.

The first "jet" engines which came to Kelly for full depot overhaul were actually turboprop engines: the T34 of the C-133 and the T56 of the C-130. The first T34 came to the depot in April 1957, with the first

The first T56 "turboprop" engine to enter Kelly's shops arrived in November 1955. Engineers used it to prototype repair procedures.

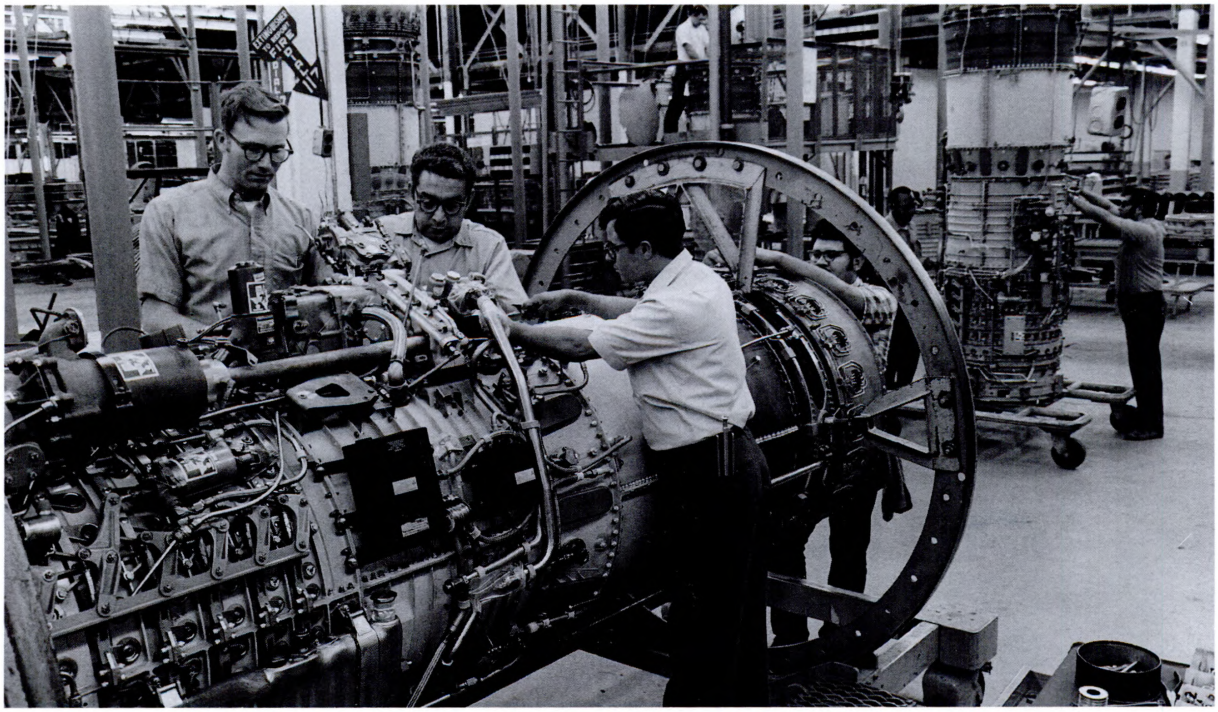

T56 arriving at Kelly in November 1955. Production of both types rose rapidly, concurrent with a steady lowering of demand for the R4360 as the B-36 began phasing out of the inventory. Production of the T34 went from four in 1958 to 337 in 1960, while during the same years production of T56 engines went from 52 to 865. As these numbers make clear, demand for the T56 was greater than that for the T34. By 1966, Kelly was producing 1,419 T56 engines, and the T34 was slowly disappearing from the depot shops. The last T34 came off the engine line at Kelly in December 1970, but the rugged reliability of the C-130 created a steady demand for T56 overhaul for two more decades.

The True Jets

Although Kelly had served as a minor repair facility for a number of early jet engines, the main emphasis had been on inventory management. The first true jet engine overhauled at Kelly was the General Electric J79, powerplant of a number of aircraft, including the F-104 "Starfighter" and the F-4 "Phantom," which first arrived at SAAMA in October 1967. Overhaul of the J79 normally was done at the Oklahoma Air Materiel Area, but that depot was having difficulties in keeping pace with the demand brought on by the increasing air war in Vietnam. To assist, Kelly's engine shops began overhauling J79-15 engines in 1967. Eight years later, Oklahoma City was still having difficulties, so in the early fall of 1975, San Antonio took over all repair of the J79-17 as well. Indeed, overhaul of J79 engines at Kelly did not come to an end until September 1983. Planning for return of this work load to Oklahoma City actually began in 1981, with that depot becoming the repair site for the J79-15 in mid-1982. San Antonio retained the J79-17 work load for a further fifteen months. And, by this time, Kelly's maintenance personnel were already deeply involved in repairing two newer jet engines which would remain the core of the engine repair work load at the depot into the 1990s--the TF39 of the C-5 and the F100 of the F-15 and F-16.

The TF39

Powerplant of the Lockheed C-5, the General Electric TF39 is a high-bypass turbofan engine (indicated in the TF designation), developed in the mid-1960s and providing over 41,000 pounds of thrust. San Antonio became both the manager of the TF39 and the specialized repair activity for the engine on September 15, 1966. The T34 engine disappeared from Kelly's repair lines; workers assigned to it could now devote themselves to the TF39. The first TF39 entered the overhaul line in October 1970. In

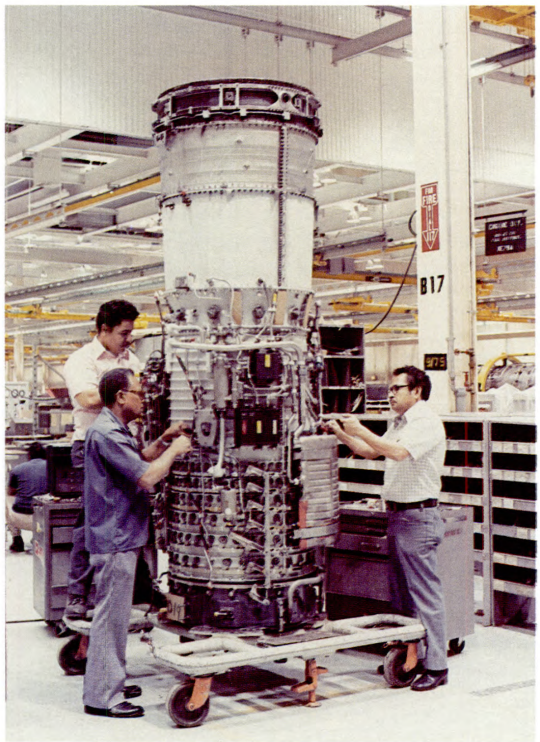

Kelly continues to both manage and overhaul the General Electric TF39 engine of the C-5.

preparation for the new work load test cells west of Military Drive, which were accepted by the Air Force in March 1970, were reconstructed.

Only two TF39 engines came off the overhaul line by mid-1971, but production jumped to ninety-nine during the next year. General Electric was still manufacturing new engines at this point, but the production of new engines ceased in December 1971. Two years later Kelly took on complete management and engineering responsibility for the TF39. Kelly engineers thus played a key role in the development of a series of technological changes which dramatically increased the engine's time between major overhauls. Beginning in 1979, San Antonio converted the TF39 engine fleet to the most recent configuration, increasing the average flying time between removals for overhaul from 3,000 to 5,000 hours. The result was both a far more reliable and long-lived engine and a rapid decline in the number of TF39 engines returned to Kelly for overhaul. During 1975, San Antonio overhauled seventy TF39 engines, but in 1976 this number dropped to twenty-eight--and management specialists predicted a decline to approximately twelve per year by 1987. A work load this size was about the least the depot could economically justify, and in 1985 Military Airlift Command agreed to supply at least two engines per month. This would allow San Antonio to maintain a repair capability and keep workers' skills current.

When American forces deployed to Saudi Arabia in the fall of 1990 as part of Operation Desert Shield, the C-5 fleet was forced to operate well beyond forecasted limits. Keeping the C-5s in the air involved a major effort on behalf of the TF39 engine, and Kelly's managers performed near miracles in keeping the number of needed engines up. On the other hand, everyone was also aware that the steady strain on the engines and the support system would eventually result in a downturn at some point. And, as American military efforts in the Persian Gulf began to wind down at the conclusion of Operation Desert Storm in March 1991, Kelly's engine specialists indeed were confronted by a drop in the availability of spare TF39 engines. Clearly, the engine would remain a major part of Kelly's work load for some time to come.

Overhaul and management of the complex F100 engine has been a Kelly responsibility since the early 1970s.

The F100: Testing the Limits of Engine Design

When SAAMA became the designated manager and specialized repair activity for the new Pratt and Whitney F100 engine, powerplant of the F-15, in October 1969, few could foresee the way this engine would come to dominate the management and engine repair activities at Kelly. The F100 represented a attempt to push jet engine technology as far as possible in a quest for dramatically higher weight-to-thrust ratios, higher speed, and, hopefully, greater ease of maintenance. Among many novel aspects, the F100 was developed from the start as a modular engine. There were five modules, and, theoretically, if one of them posed a problem, it could be replaced without the need to rebuild the entire engine.

Personnel from Kelly were involved in planning for support of the F100 from the start, but the first F100 engine did not arrive at the depot until August 9, 1974. This engine served as a model, allowing maintenance teams to check overhaul procedures and evaluate the adequacy of tools, technical orders, and other data. The first engine actually to complete the overhaul process came off the line in September 1975.

When LOGAIR began operation, contract carriers often flew surplus World War II transports such as this former C-46.

LOGAIR

By the early 1950s, American airpower could leap oceans and continents to deliver tactical or strategic attacks in support of national strategy. But the speed and flexibility of airpower were, as World War II experience showed, limited by a logistics support system that still relied on road, rail or ship transportation. The arrival of the 3rd Transport Squadron at Duncan Field in the mid-1930s marked an early attempt to escape this situation through the use of air transport, but it was not enough. During the Korean War the Air Force began relying to some extent on civilian contract airlift, and by 1954, it was apparent that some sort of contract system for domestic airlift was a necessity.

After studying the issue, Air Materiel Command concluded that the Military Air Transport Service could not operate a dependable domestic air cargo service in peacetime, and that a contract system could be run at half the cost of commercial service. Thus, on April 1, 1954, a contract system known as the Mercury System began ferrying cargo between domestic depots, and from the depots to aerial ports of embarkation for overseas deliveries. The contract carriers owned their own aircraft, flew only within the continental United States, and the cargo they carried was primarily urgently needed items. By August 1954, this contract system was known as LOGAIR, or Logistics Airlift.

Over the next thirty-five years, the LOGAIR system more than showed its worth. By 1957, LOGAIR flights moved over 3,000 tons of cargo along a complex series of routes. Flights went into eleven locations in 1954, and twenty-five locations just four years later. By the mid-1980s, Kelly alone was handling some 5,400 tons of LOGAIR cargo every month, and the number of carriers had grown from two, flying war-surplus C-46 transports, to five, flying DC-9 jets and L100 four-engine turboprop transports. (The L100 is the civilian version of the C-130 transport.) More than simply saving money and time, LOGAIR proved a profitable and effective way to move priority cargoes rapidly, and by the end of the 1980s was a key part of the Air Force logistics infrastructure.

Unfortunately, the F100 engine did not live up to the promise of its technological innovativeness. From the start there were numerous problems, a situation exacerbated by the failure to purchase sufficient spare parts during the first few years. First stage turbine blades, for example, lasted only 700 hours instead of 1,200 hours, and even the emergency purchase of 88,000 blades did not solve the problem. Main fuel pumps failed due to erosion in the sideplates; defective clock oscillators broke down in the electronic engine control of 350 engines; augmentor pumps leaked; and the unified fuel control proved to be a constant source of problems for years.

Bringing the number of spare engines up to required levels proved almost impossible, and the situation was further aggravated by the need to provide support for two separate variants of the engine. The F100-PW-100 powered the F-15, while the F100-PW-200 powered the F-16. Although these engines were essentially similar, the F-16 variant carried a number of different items--including a digital electronic engine control--not on the engines that went into F-15s. This was due to the fact that the F-15 had two engines and the F-16 only one. The F-15 thus had built-in redundancy, while the Air Force hoped to decrease the likelihood of an engine failure causing the loss of an F-16 by adding features to the engine. However, since the engines were not interchangeable, the differences meant that San Antonio managers had to provide for what amounted to two different engines.

In the mid-1980s, San Antonio began implementing a scheme to increase the longevity of both F100 variants through the installation of a redesigned core module. Known as the Increased Life Core, this development, largely the result of continuous efforts by both the Air Force and Pratt and Whitney under the Component Improvement Program, promised to nearly double the expected service life of the core--the "firebox" of the engine. In addition, while still trying to cope with an apparently endless series of problems with turbine blades, electronic controls, and the augmentor (or afterburner), San Antonio's F100 managers also pushed forward with planning for a third variant, the F100-PW-220. Planners hoped that this variant, which would include all the longevity developments, including the Increased Life Core, would offer substantial improvements in reliability. In addition, planners expected this third variant to be suitable for either the F-15 or the F-16, eliminating the need to support two separate engines. By 1990, a program was underway to modify all existing F100 engines to the -200 configuration (resulting in an engine known as the F100-PW-220E, the E standing for equivalent). While the complete results of this upgrade remained unknown by 1991, test results from squadrons equipped with -220 engines suggested that, even if the engine did not live up to the most optimistic expectations, it still represented a large forward stride in terms of reliability and supportability.

Changing Concepts of Management

Throughout the 1950s and early 1960s, Air Force logisticians dealt with a technological world which was changing at an increasingly rapid pace. At the same time, the Air Force was committed to the maintenance of both first-line defense and constant readiness. Coping with the changing technology of air weaponry while attempting to maintain a force that was also immediately ready for combat was a totally new experience for any branch of the American military. In the past, changes to weapons had been incremental and evolutionary, but by 1960 the shifts between the end of the Korean War and 1960 had been dramatic. Moreover, despite the belief that the "next" war would be fought with existing equipment (planners did not believe that there would be time to retool American industry for war production, or make substantial changes to existing weapons once

The increasing use of computers aided management of increasingly complex systems.

war began), the pace of technological change prevented stockpiling large quantities of material. The choice was to build-up a large supply of weapons and parts, or steadily develop new weapons to reflect the emergence of new technological advances. The Air Force chose to do both, placing a tremendous strain on its arrangements for procuring and maintaining its systems.

Prior to World War II, a handful of depots serviced specified geographic areas. Since the types of aircraft within any given area might vary, the depots dealt with a wide variety of aircraft and engines. A large proportion of major overhaul work was done by the manufacturer, but the depots still stockpiled a wide array of items. During the war, though, Air Materiel Command introduced the concept of specialized repair, funneling certain aircraft, engines, or components to specific repair centers. The Fairfield Depot handled B-17s, for example, while San Antonio increasingly dealt with B-29 heavy bombers. This did not preclude a depot from repairing other types of aircraft, of course. At one time or another, San Antonio handled nearly every type of aircraft in the inventory. But it did simplify the stockpiling of parts and made the training of new workers somewhat easier.

During the late 1940s, the Air Force continued this approach, dividing the United States into two zones and making a depot in each zone responsible for specified classes of equipment. However, this system was not entirely successful during the Korean War (when Far Eastern Air Forces sometimes had to obtain what it needed through Army supply channels), and in the early 1950s Air Materiel Command set out to revise the entire system of supply, maintenance, and support.

Weapon System Approach

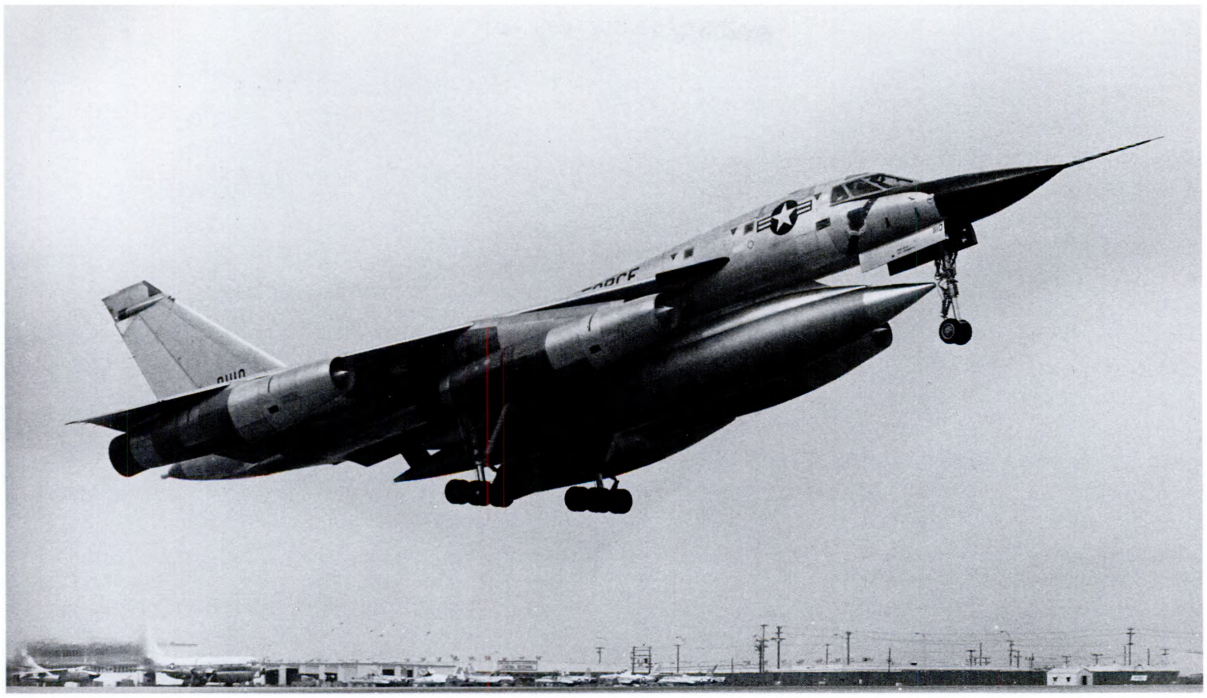

In 1953, Air Materiel Command adopted a logistics strategy which aimed at eliminating the prestocking of overseas depots and reducing the amount of material in the supply pipeline at any given time. In addition, the Air Force began to move away from the traditional management of commodities--i.e., the equipment used in a variety of aircraft--toward the management of all the components of an aircraft as part of a single integrated weapons system. Such a move could not end the management of commodities altogether, but it did allow a single manager to hold responsibility for all spare parts and equipment associated with a particular aircraft. At the headquarters level, the organization set up to accomplish this during development and procurement of a new weapon system was called a joint project office (weapon system project office after 1953).

At the same time, arrangements for the logistical support of operational systems evolved in a similar direction. After testing the idea at Oklahoma City in 1954, Air Materiel Command established weapon system managers at all the AMAs in 1956. Under this arrangement, the AMA selected to manage a particular weapon system became the "lead" AMA for that system, with the AMA commander designated as the logistics support manager. At the end of 1957, AMA also designated specific AMAs as managers for classes of aircraft, with Kelly's depot assigned bombers and transports. In addition, AMAs continued to manage commodity classes. In 1958, AMC went another step farther by directing each AMA to form a Directorate of Logistics Support as a central point for all management concerns, both systems and commodities.

Organizational Changes at SAAMA

These changes were reflected in a series of organizational changes at SAAMA during the same years. During the mid-1950s, representatives from the SAAMA Directorates of Supply, Procurement, and Maintenance, and the Plans and Programming Office met regularly as part of Weapon System Phasing Groups. One of these groups existed for each weapon system assigned to San Antonio, and these groups met at regular intervals with their counterparts at AMC headquarters. There, representatives from the using commands and the principal contractors joined them in making decisions in regard to solving support issues. In March 1955, SAAMA set up the Delta Cover Program to provide a single source of support for the F-102. This arrangement was not, as it turned out, entirely satisfactory to all the agencies involved, but it did serve as an important step in the process of reforming logistics support.

During 1957, Major General Thetus C. Odom, SAAMA commander, assigned Colonel Roger L. Kettleston as Assistant to the Commander, and designated him as Deputy Director of Supply, Deputy Director of Procurement, and Deputy Direc-

The need to effectively manage systems such as the B-58 "Hustler" spurred the formation of the Directorate of Logistics Support Management in 1959.

tor of Maintenance for the F-102. Again going outside the existing organizational framework, this step centralized control over F-102 support. It was followed by realignments within the Directorate of Supply and Services centralizing management of both F-102 and F-106 systems.

In early 1958, SAAMA created the B-58 Logistic Support Management Office to coordinate support efforts for the B-58 and separate these activities organizationally from internal depot operations. First established in May, this new office did not actually begin carrying out its tasks until the end of June. Housed at first in building 171, it was soon relocated to East Kelly where it took over the former offices of the Continental Division of the Military Air Transport Service in building 3030.

The next step was the creation of a distinct management directorate, a step actively encouraged by General Odom and directed by AMC in the fall. As outlined by AMC, the new organizaton would be implemented gradually in a two-phased process which, in addition to creating a centralized management directorate, would combine supply and maintenance operations in a Directorate of Industrial Operations. General Odom, however, obtained permission to follow a slightly different tack at SAAMA, and the depot organization which emerged in January 1959 at San Antonio kept supply and maintenance separate. Within the new Directorate of Logistics Support Management, different divisions held responsibility for each major weapon system (B-58, F-102/106, and B-70). All other assigned aircraft went into a Miscellaneous Aircraft and Commodities Division, while engines were handled by another separate division, and a final division dealt with engineering and support issues. Although the creation of this new organization did not solve all problems immediately (there were numerous adjustments that had to be made throughout the depot, and making them took time), it did establish a permanent, centralized organization to manage weapon systems on a worldwide basis and marked the culmination of a decade of experimentation in management. The Directorate of Logistics Support Management was renamed the Directorate of Materiel Management in February 1960 and, despite several internal restructurings, remained a cornerstone of depot organization through the end of the 1980s.

Before General Hudnell Drive existed, Kelly workers traveled to and from the base via the Frio City Road.

General Hudnell Drive

The enormous expansion of the depot work force at Kelly from World War II to 1960 led to daily traffic jams along the roads leading to the base. Construction of General McMullen Drive in 1950 was only a partial solution to the problem. However, efforts to convince San Antonio voters to approve a bond issue to pay for the building of another access road seemed doomed when the issue was defeated in June 1960. Rather than simply accepting this result, Major General William T. Hudnell, the new San Antonio Air Materiel Commander, energetically set out to reverse it. In October, the San Antonio City Council expressed its reluctance to resubmit the question to the voters, unless it was clear there was a overwhelming public support for such a step. Led by General Hudnell, a massive public relations campaign was soon underway to generate exactly the kind of focal support the council wanted to see--a campaign that was crowned with success when voters approved a new expressway by a four-to-one margin in January 1961.

Construction got underway in the fall of 1964, and the completed access road was opened in January 1967. The City Council, recognizing the key role played by General Hudnell, officially named the road in his honor in February 1965. In September 1989, a plaque memorializing General Hudnell and his role in the creation of the access road was unveiled in a formal ceremony. In his speech, San Antonio Air Logistics Commander, Major General Richard D. Smith, pointed out that General Hudnell Drive was "more than just a road," it was a constant reminder of the close ties that have bound San Antonio and Kelly Air Force Base in partnership for more than three generations.

Major General William T. Hudnell

Major General William T. Hudnell commanded the San Antonio Air Materiel Area from August 30, 1960 through June 1, 1965. A specialist in air logistics with a wealth of first-hand experience in modernizing military logistics techniques, he was also a fighter pilot and an Air Force planner.

He enlisted in the Air Corps in January 1931, earning his wings and commission at Kelly Field's Advanced Flying School during the summer of 1933.

During more than thirty-four years of military service he was assigned in many parts of the world, and particularly in the Pacific area where he served as Chief of Logistics in the Far East Air Forces during World War II and later commanded the Air Materiel Forces, Pacific. In addition, he held staff positions at Headquarters Air Force Logistics Command.

General Hudnell was rated a Command Pilot. During World War II, he flew thirty-five combat missions in the Southwest Pacific Theater and was credited with the kill of a "GEORGE" fighter plane for which he won the Air Medal. He received the Distinguished Flying Cross for successfully landing a plane with jammed controls.

General Hudnell also held the distinction of serving as the Wing Commander of the very first combat-ready jet fighter wing in the Air Force.

Crises of Early 1960s

Two major foreign relations crises erupted in the early 1960s, both of which demanded heightened activity at the San Antonio Air Materiel Area. The first was the Berlin Crisis of 1961. In June, President John F. Kennedy met Soviet Premier Nikita Khruschev in a summit conference in Vienna, Austria. In the aftermath of this conference, sensing an opportunity to bully the younger American president, Khruschev threatened to tear up the Four Power Agreement governing Allied occupation of Berlin. Kennedy responded with a dramatic show of force, beefing up United States military forces in the western sector of the city, calling up 75,000 reservists a month later, and visiting Berlin in an emotional gesture that captured world attention.

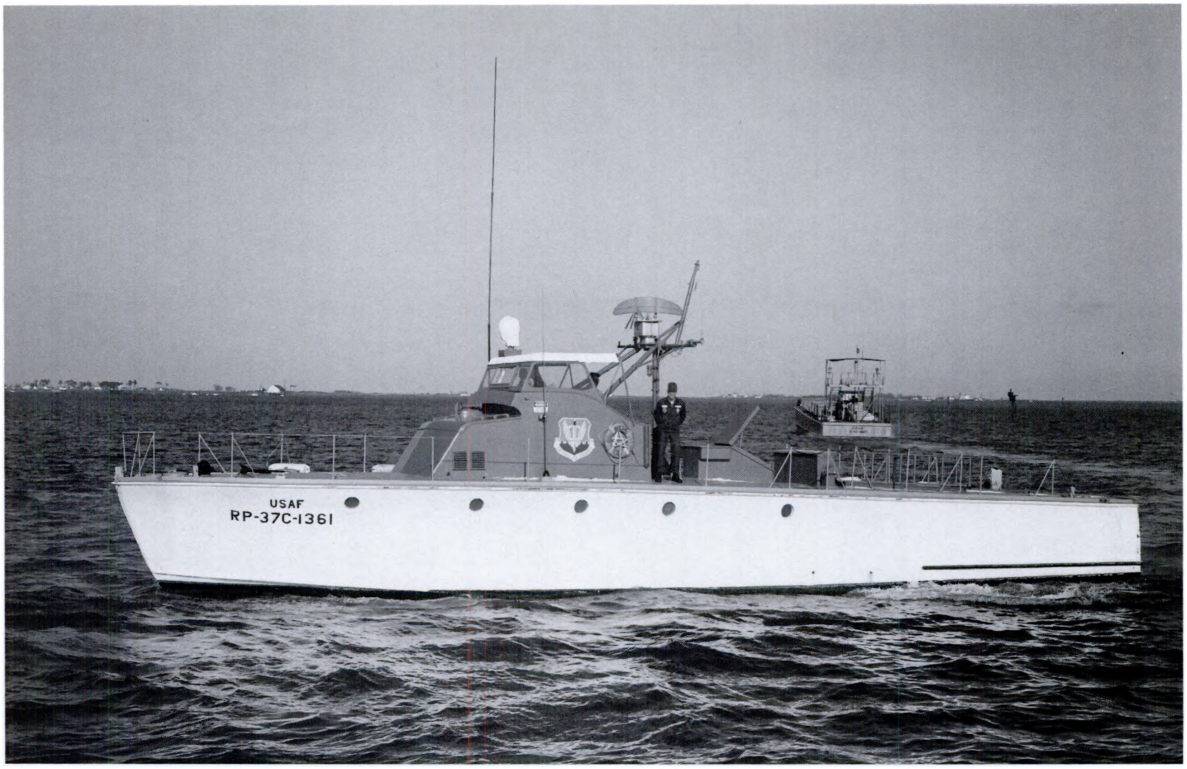

The call-up of sixty-four Air National Guard units and seven Air Force Reserve units--25,000 guardsmen and 3,000 reservists--was authorized on 1 August 1961. By the time most of these units reached active duty, Soviet closure of the border between East and West Germany had further heightened tensions.

In support of American forces already in Europe, and to assist in this mobilization, SAAMA rapidly increased the movement of supplies from the depot to units overseas. The airlift also increased pressure on Kelly's maintenance shops, which had to increase the rate of production for engines such as the R4360 and T56.

Just over a year later, a Soviet attempt to place intermediate range missiles in Cuba resulted in the Cuban Missile Crisis of October 1962. The announcement that the Soviet Union had established ballistic missile sites in Cuba, followed by the imposition of an American naval quarantine of the island, brought the world close to World War III.

Ultimately, Soviet vessels carrying missiles to Cuba turned around and tensions eased. But for a few weeks, the United States was at the brink. Most citizens could only hold their breath, but workers at Kelly were called upon to dramatically increase the output of B-52s in depot overhaul. The overtime costs were twice those anticipated for the year, but the job, which for many San Antonio Air Materiel Area offices involved twenty-four hour activity seven days a week, was done.

Management of Air Force watercraft, such as this missile retrieval boat, became a Kelly responsibility in 1965.

Depot Consolidation in the 1960s

During the mid-1960s, the Air Force reduced its aircraft inventory through the retirement of older weapon systems in favor of newer aircraft and missile systems. At the same time, at the direction of Secretary of Defense Robert S. McNamara, Air Force Logistics Command (AFLC) sought to improve the efficiency and cost-effectiveness of its operations through the consolidation of its depots. Between December 1963 and November 1964, Secretary McNamara announced the phase out of four of the existing nine depots: Rome, Middletown, Mobile, and San Bernadino would close. Their work loads were picked up by the remaining five depots.

For San Antonio this meant the gaining of a number of new responsibilities. From Middletown, San Antonio took on management of five aircraft systems: the F-5, the T-38, the T-37, the U-3, and the P2V5. San Antonio also became the item manager for the federal supply classes covering parachutes, aerial pick-up equipment, specialized flight clothing, and precision measuring equipment calibration items. In addition, the Directorate of Aerospace Fuels relocated from Middletown to San Antonio, bringing with it an additional 1,783 personnel authorizations.

From Mobile, item management for thirty-five supply classes came to Kelly, along with responsibility for the Department of Defense sentry dog program (August 2, 1965), the Air Force watercraft program (November 1, 1965), and non-aircraft engines (August 16, 1965). In all, the transfer of these areas of responsibility to SAAMA brought a further 2,330 personnel authorizations. But, of the over 4,500 new authorizations at SAAMA, only 1,406 were filled by people transferring to San Antonio from the eliminated depots. The remaining slots were filled by people hired locally, giving the San Antonio city economy a large boost. Of course, finding the necessary office space to accommodate so many new people was a problem. Building 43 was converted into office space, three buildings (1622, 1623, and 1624) were rebuilt into a single structure to house the Comptroller, and another 191 square-feet of space in building 171 was converted from warehouse to office space.

President John Fitzgerald Kennedy

On November 21, 1963, the President of the United States, John F. Kennedy, accompanied by the First Lady, arrived at Kelly Air Force Base. The President was in San Antonio to dedicate the Aerospace Medical Division Complex, located at Brooks Air Force Base. The San Antonio Air Materiel Area Commander, Major General William T. Hudnell, and his wife greeted the President and Mrs. Kennedy upon their arrival at Kelly.

More than 17,000 people gathered along the flight line to wave hello to the President and Mrs. Kennedy as they departed the San Antonio area on their way to Dallas. On November 22, 1963, twenty-one hours after his visit, President Kennedy was killed by an assassin's bullet while traveling in a motorcade in Dallas.

After being sworn in as the new President, Lyndon B. Johnson declared November 25, 1963, the day of the late President's funeral, a national day of mourning. Over 860 people attended memorial services at Kelly's chapels. The official period of mourning for President Kennedy lasted from November 22 to December 22, 1963.

SAAMA and the Vietnam War

On August 4, 1964, the United States destroyers *USS Maddox* and *USS Turner Joy* were patroling approximately sixty miles off the coast of North Vietnam when the two ships reported that their sonar showed them under attack by North Vietnamese torpedo boats. There was no visual confirmation, but in retaliation President Lyndon Johnson ordered air strikes against the torpedo boat bases and nearby oil storage facilities. Congress responded with the Gulf of Tonkin Resolution, giving Johnson authority to use military force in Southeast Asia. With these steps, the United States entered what would become the country's longest and most divisive war.

Support During the Early Years

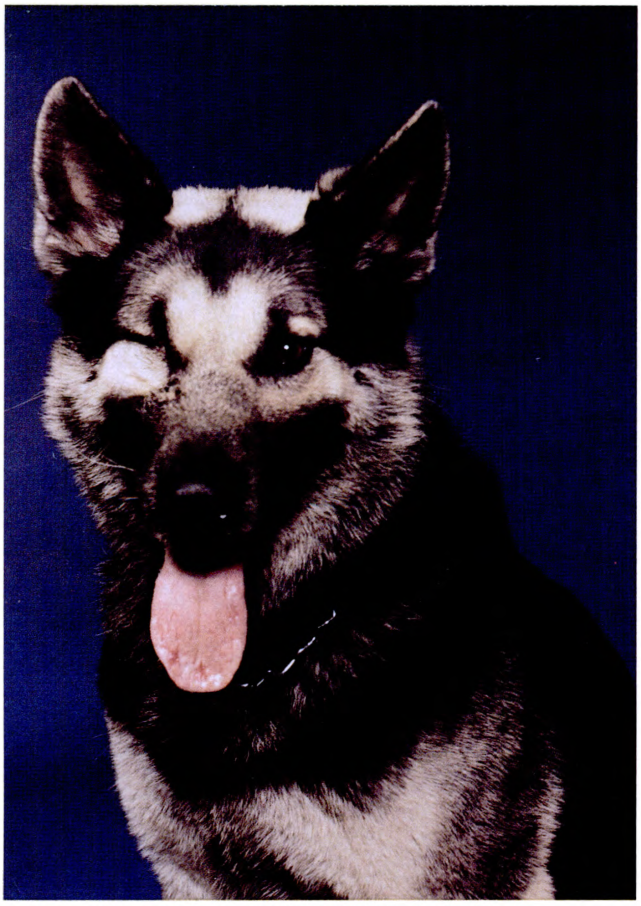

Kelly's efforts on behalf of American and Allied forces in Southeast Asia began immediately. As early as August 5, SAAMA joined the other AMAs in providing twenty-four hour a day supply and maintenance support. In May 1965, as American ground forces began deploying in South Vietnam, SAAMA set up the first of a series of field teams to travel to the area. By December 1965 some eighty-nine SAAMA personnel, both civilian and military, were overseas temporarily.

Even larger numbers of Kelly personnel traveled to other locations within the United States to provide needed skills. During 1966, for example, 571 SAAMA employees were on temporary duty at other locations at one time or another. Most of these were civilian members of maintenance field teams which traveled to other bases within the United States. All 135 members of the supply field teams, however, were sent to overseas bases in Southeast Asia, along with about a fifth of the civilians assigned to maintenance field teams. By the end of 1966 just over 1,900 positions out of the 22,100 people at SAAMA were dedicated solely to support the Vietnam war effort.

Of course, in one way or another, most of the rest were also working to support the war effort, even if their jobs were not specifically authorized for Southeast Asia support. The main B-52 work load in the depot shops involved modifications to B-52Ds, enabling the big bombers to carry a heavier conventional bomb load. Eighty-two "Stratofortresses" went through the modification during 1966, and much of this work had to be done outdoors. The large maintenance hanger was, despite its size, too small to accommodate the number of aircraft undergoing modification. Yet, despite the difficulties, most of these aircraft were completed ahead of schedule.

The number of engines going through overhaul also increased. Particularly important were T34 and T56 turboprop engines. Kelly engine shops produced 265 T34 engines in 1966, almost all destined for Southeast Asia, and over 1,400 T56 engines. While most of these were destined for domestic or European based aircraft, about a third went to South Vietnam.

The Department of Defense Dog Center

"Nemo," the most famous dog in the Air Force.

In 1964, the Air Force assumed responsibility for managing the Department of Defense working dog program. Initially, the home of the program was the Mobile Area Materiel Area, but when that facility closed, San Antonio took over the task of computing requirements and funding the program while Air Training Command took care of housing and training.

Four years later, all logistics management became a Kelly responsibility. Since Kelly had no kennels, Air Force Logistics Command established Detachment 37 on Lackland AFB to handle the program.

A variety of breeds served as working dogs, although the most common, and certainly the most famous, were German Shepards. The Air Force and the Army were the largest users of dogs, many of which were trained to detect either drugs or explosives. Most were trained as patrol dogs, though, and the most famous of these was a German Shepard named Nemo.

On December 4, 1966, Nemo and his handler, Airman Second Class Robert Throneberg, were patrolling the perimeter of Tan Son Nhut Air Base in South Vietnam when they ran into a group of Viet Con infiltrators. In the ensuing struggle, both Nemo and his handler were wounded.

Nemo was credited with driving the enemy off and saving Airman Throneberg. Despite losing an eye in this encounter, Nemo completed his tour and returned to a hero's welcome at the Dog Center in July 1967. There he lived the life of a celebrity until his death in March 1973 at the age of eleven.

There were a number of ways dogs entered the program. For some time, the most common method was for owners to send the center photographs of a dog, together with a description of the dog's characteristics and a quote for the lowest price the owner would accept (to a maximum of $250).

If the dog was accepted for evaluation, the center arranged for shipment to Lackland. Typically, less than twenty percent of the potential dogs were accepted for evaluation, and then only sixty percent of the dogs evaluated were accepted for training.

Another method of obtaining dogs was through a traveling procurement team. The team would establish an evaluation center in a large metropolitan area and advertise for owners to bring in prospective dogs. In this way a large number of dogs could be evaluated without the shipping expenses of the "mail order" program.

By the mid-1980s, the Dog Center was also traveling overseas to find additional sources of dogs. Despite the costs of traveling to Europe, these buying trips provided an economical and valuable source of dogs for the program.

On October 1, 1990, the San Antonio Air Logistics Center turned over the logistics portion of the military working dog program to Air Training Command's 3250th Technical Training Wing at Lackland Air Force Base. During the years Kelly administered the program, approximately 10,000 dogs were bought and then trained in patrol, explosive, and drug detection.

Aerial Port of Embarkation

On July 1, 1965, Kelly began operating an Aerial Port of Embarkation, establishing direct cargo service between SAAMA and the Far East Service went through five existing Military Airlift Command routes from Kelly to Tachikawa Air Base, Japan; Kadena Air Base, Okinawa; Kimpo Air Base, Korea; Clark Air Base, Philippines; and Saigon, South Vietnam. Five further channels were added in 1967, three to bases in Thailand (Bangkok, Don Muang Airport, and Udorn Airfield) and two to bases in South Vietnam (Da Nang and Cam Ranh Bay.) Later, the channels to Thailand and Korea were shifted to the aerial port at Oklahoma City, with Kelly adding Phu Cat Air Base in South Vietnam.

A combination of old facilities and inexperience created problems at first, but in 1967 the facilities were updated through replacement of the old warehouse conveyor system with a new high-line system and expansion of outside storage. Additional trailer-mounted conveyors, added unloading ramps, and newer punch-card accounting devices also helped speed the loading and unloading of cargo, allowing pallets to go directly from truck to aircraft. A further plus was the increasing use of the C-141 Starlifter. Able to carry over 67,000 pounds of cargo, these large jets steadily replaced the older, piston-engined C-124s during 1967. By 1968, C-141s accounted for sixty percent of the outbound flights from Kelly's aerial port. By this time, too, delays were almost non-existent. Of 2,700 flights, carrying some 55,000 tons of cargo in and out of the port in 1968, only five experienced any delay.

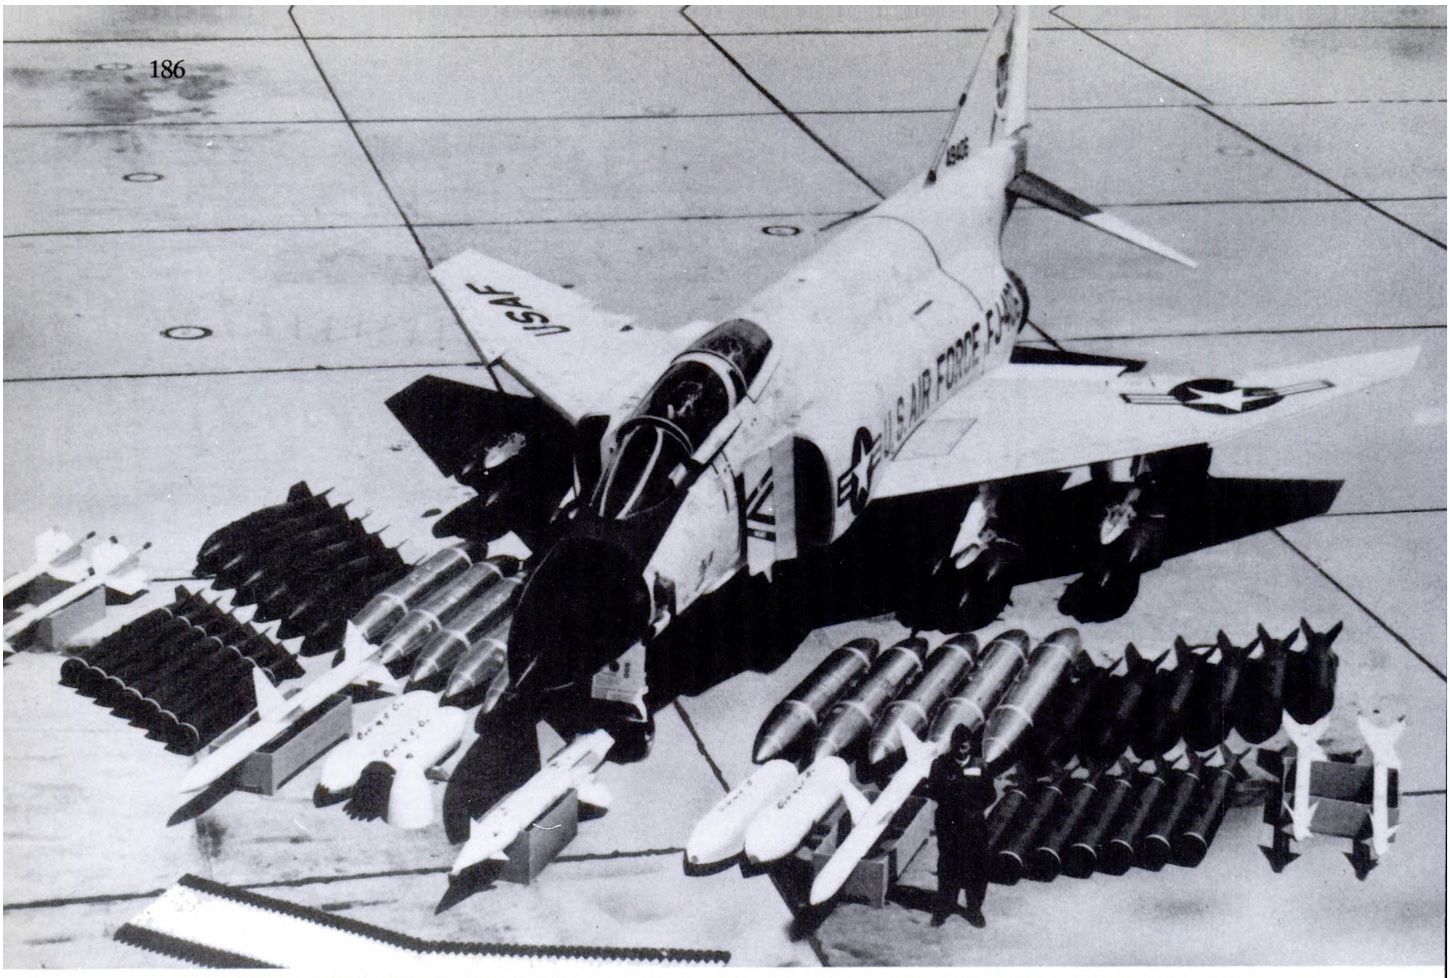

Only about twenty percent of the outbound cargo was generated at Kelly. The remainder came by truck and rail from throughout the region between the Rocky Mountains and the Mississippi River. Traffic control was vital, as was accurate accounting of items in storage. While incoming cargo was subject to customs inspection and quarantine, aerial port workers were concerned primarily with speed in getting the outbound flights loaded and on their way. During one period in 1968, outbound cargos also included numbers of crickets, then infesting south Texas, and outbound aircraft were delayed when they passed through Japan. Unfortunately, insect control efforts were not entirely successful.

Project LOGGY SORT

In August 1966, AFLC headquarters began a study to evaluate the optimum amount of repair and overhaul work which could be done by field units at overseas bases versus returning items to depots. Although Pacific Air Forces was moving toward a goal of greater self-sufficiency at its overseas bases, AFLC headquarters argued that it made more sense

B-52 modifications were a large work load at Kelly during the Vietnam War.

Project LOGGY SORT evaluated the amount of maintenance that an F-4 unit could accomplish in the field.

to limit maintenance at forward bases to the removal and replacement of items. Repair and overhaul work at the forward bases would be limited to only those items which could be repaired quickly or those in high demand. Striking the proper balance between the repair work done at the base or at depot, required an analysis of the time and costs involved.

The project was codenamed LOGGY SORT, with "LOGGY" being the designater for an AFLC project and "SORT" standing for Specialized Overseas Repair Test. When the designator for AFLC projects changed from LOGGY to PACER in August 1967, the project was renamed PACER SORT. Getting the project underway required the creation of a task force at AFLC headquarters, along with a team to evaluate repair efforts overseas, another team at the Ogden Air Materiel Area (depot for the F-4 aircraft) to evaluate depot effectiveness, and project offices at each of the other AMAs. The F-4C was chosen as the aircraft system to investigate, and Cam Ranh Bay was chosen as the base in Vietnam where field repair efforts could be evaluated.

The SAAMA project office came into being in October 1966. At first it consisted of only six people, but another twenty personnel slots were added during the year. By June 1967, the SAAMA group had guided the creation of item-records for approximately 325,000 pieces of aerospace ground equipment related to the F-4C and analyzed ninety-two items managed by SAAMA to establish base level repair restrictions. Data collection ended in October 1967, and SAAMA personnel assisted the evaluation team at Ogden in analyzing and verifying the results. To a large extent, these results appeared to confirm AFLC's arguments that the complexity and sophistication of modern aircraft and weapon systems made it exceedingly difficult and expensive to establish complete overhaul facilities at forward locations. But, at the same time, it was clear that forward units had to be equipped to handle at least some portion of their repair and overhaul needs if they were to retain their flexibility and ability to carry out their missions.

Support During the Later Phases of the War

Among San Antonio managed aircraft, the F-102, the O-2, the A-37, and the F-5 all played roles in the aerial campaigns in and around Vietnam. Used almost entirely in an air defense role, the F-102 was soon superseded by the F-4. Forward observers and air controllers used the O-2 to spot ground targets and direct the strikes of ground support aircraft. The A-37, introduced into the inventory in 1967, was designed for close air support in counterinsurgency operations, and the F-5 was supplied to allied countries under the Foreign Military Sales (FMS) Program. As the war continued, SAAMA efforts were increasingly aimed at supporting these two aircraft.

A-37 Support

The first A-37s were converted T-37 trainers, removed from storage, converted to an attack configuration, and designated A-37As. They began operating in South Vietnam during 1967. New aircraft, built from the start for the attack role, were designated A-37B and began reaching Vietnam in September 1968. Under FMS, SAAMA assisted in equipping three A-37 squadrons of the South Vietnamese Air Force through the creation of support packages of spare parts and aerospace ground equipment for each of the squadrons. In addition, SAAMA maintenance personnel performed system and armament checks on sixteen A-37s, which arrived in Vietnam during the fall of 1969.

Volunteers from the San Antonio Air Materiel Area were sent to Vietnam to assist with such weapon systems as the A-37.

F-5 Support

Northrop designed the F-5 "Freedom Fighter" from the start as a relatively inexpensive, yet modern and versatile, fighter for export to Allied countries. Production began in 1962, and during 1964 the Air Force evaluated the F-5 under combat conditions in Vietnam in a project called "Skoshi Tiger." The aircraft in the test were modified FMS aircraft, flown by American pilots. After completion of the test, F-5s began entering the inventories of several Allied air forces in the Pacific region. The 3rd Tactical Fighter Wing continued to fly its own F-5s out of Bien Hoa Air Base for another year. But in April 1967, the wing was deactivated and its aircraft and equipment were transferred over to the South Vietnamese.

Although the F-5 was successful in its role as a fighter-bomber, a number of problems appeared during active service. It could not operate in heavy rain, for example, and the air conditioning system sometimes caused condensation inside the canopy. Other problems involved failures of the explosive bolts used to jetison pylons and damage to the engines from debris thrown up by the aircraft's own bombs. To help alleviate these problems, SAAMA developed three modifications and, when efforts to install them through contract failed, sent a three man team from Kelly to Vietnam in April 1967. Within a month, the team completed the modifications, and left Vietnam on May 20.

Herbicide Management and Storage

One of the most controversial steps taken by American strategists during the Vietnam War was the 1961 decision to employ chemical defoliants. Most of the controversy surrounding the use of herbicides has emerged since the war ended. At the time, there was little information about possible long-term side effects, and the use of herbicides seemed to offer a reasonable way of denying the enemy hiding places and food supplies.

Throughout the war, herbicides were managed by the Directorate of Aerospace Fuels, the Air Force organization with the greatest experience in the safe handling of hazardous chemicals. Although aerial spraying of defoliants began in 1961, the period of greatest use was 1966 through 1970, with a peak in 1968. The most effective, and ultimately the most controversial, herbicide was Agent Orange, but other chemical defoliants were used as well. Indeed, by 1968 it was clear that more defoliant had been procured than would be used, creating both storage and disposal problems.

A number of alternatives for disposal of excess herbicides were explored as the decline in their use in Southeast Asia built up stockpiles. Possible uses for some of the herbicides included scrub brush control on bombing ranges and aquatic weed control in African rivers. None were adopted. Instead, starting in March 1977, some 2.2 million gallons of Agent Orange were carefully loaded aboard a Dutch incinerator ship, and burned out at sea. The job was finished in early September, and the vessel cleaned. However, despite American tests (verified by a Swiss laboratory) that showed the vessel was uncontaminated, Dutch authorities refused to let it enter a Dutch port. Ultimately, its owners presented a claim to the Government for $2,000,000 to cover losses while the ship was out of service.

Aerial spraying of herbicides in Vietnam not only took away "Charlie's" cover, it destroyed his rice crop as well. Enemy territory on the left was sprayed, while friendly fields on the right bank of the river were spared.

Fifty-five gallon drums of Herbicide Orange wait to be loaded aboard the Dutch incinerator ship "Vulcanus," where the herbicide would be mixed with diesel fuel and burned far out to sea.

SAAMA Support for the Electronic Ground War

In mid-1966, Secretary of Defense Robert McNamara brought together a number of scientists and engineers to examine the on-going air campaign and suggest ways to make it more effective. Among the recommendations of this group--informally known as the "Jason Group", after the division of the Institute of Defense Analyses which organized the meeting--was the construction of an electronic zone in which sensors could detect the presence and location of enemy troops, giving aircraft accurate coordinates for an attack. McNamara enthusiastically supported the idea, but it soon became clear that the cost of creating such an area covering the entire demilitarized zone between North and South Vietnam would be prohibitive and would involve several hundred ground troops as well. Instead, a program called IGLOO WHITE emerged, in which sensors were deployed along the so-called Ho Chi Minh Trail--a network of roads and trails leading from North Vietnam through Laos and Cambodia to South Vietnam. There were a wide variety of sensors, from vibration detectors to infrared devices, which sent data to aircraft circling overhead. These aircraft relayed these signals to the Infiltration Surveillance Center at Nakhon Phanom, Thailand, where, with the aid of computers, they were plotted on monitors. Technicians could then direct aircraft to the specific coordinates shown, theoretically increasing the chance for an effective strike on a convoy.

The IGLOO WHITE program began during late 1967, but SAAMA was not involved until 1970 when Kelly personnel developed the plan which established the procedures for Air Force procurement, storage, palletization, distribution, and testing of Phase III sensor modules. During 1971, SAAMA took over management responsibility from the Defense Communications Planning Group for several ground sensors: three seismic detectors, a commandable microphone, and an engine emission detector. At the same time, SAAMA began handling the storage and shipment of sensors, with the first assets arriving at Kelly in July. In 1973, IGLOO WHITE was discontinued and replaced by a follow-on program called Dart Sensor. Sensor activities in Southeast Asia were stopped, and SAAMA personnel managed the return of sensors to storage in the United States.

A subsidiary program called PAVE EAGLE also involved SAAMA personnel. The purpose of this program was to develop unmanned, reconnaissance drones which could carry cameras and sensors or

Robert D. Fuentes, left, of the Aerospace Ground Equipment Item Management Division, demonstrates sensor flaps that prevent penetration above the antenna to SSgt. Joe Eldridge, an instructor at the Camp Bullis Combat Preparedness Training Course.

A Commike III sensor, typical of those dropped along the Ho Chi Minh Trail as part of IGLOO WHITE.

serve as airborne relays for data picked up by sensors on the ground. Although the Aeronautical Systems Division of Air Force Systems Command managed the program, SAAMA was called upon to help overcome difficulties with the engine. However, in 1973, concurrent with the end of direct American involvement in Vietnam, the program was terminated.

Vietnamization

The term "Vietnamization," first enunciated publically by the administration of President Richard M. Nixon in 1969, was based on conclusions reached by a wide range of military and civilian leaders in the aftermath of the North Vietnamese Tet Offensive in 1968. In essence, Vietnamization called for the South Vietnamese to bear the burden of the fighting while American efforts went toward supplying them with arms and equipment. For SAAMA, this new policy meant increased effort toward building up South Vietnamese maintenance and supply facilities, as well as continuing efforts to deliver aircraft and spare parts.

Bien Hoa

In November 1970, SAAMA sent an industrial engineer to assist an Air Force Advisory Team in evaluating a proposed engine overhaul facility at Bien Hoa Air Base. By February 1971, AFLC headquarters had given SAAMA the complete responsibility for developing plans to reconstruct an existing building at Bien Hoa, turning it into an engine overhaul shop. As a team of engineers, technicians, and engine specialists went to work on this project, they were also handed the task of developing the utility design for the Navy office actually doing the construction work.

The new facility was finished in June 1971, and SAAMA then supplied all the equipment along with a full engineering and planning package for the overhaul of J85, T53, and T55 engines. Despite delays caused by a rocket attack, the facility was in full operation by mid 1972. In September, after another rocket attack, the Sacramento Air Materiel Area asked for civilian volunteers to help reconstruct the plumbing and electrical systems. Ten SAAMA workers volunteered, followed by fourteen more,

In 1966, the Air Force authorized this sterling silver lapel pin to recognize civilians who served voluntarily for thirty or more days in Vietnam after January 1, 1965.

who went to Bien Hoa to help set up scheduling, work measurement, and management systems at the facility. Less than a month later, another San Antonio group went to the site to help establish the processes for J85 and T53 engine repair. The facility successfully tested a T53 engine in November and a J85 engine in December, enabling full scale overhaul to get underway a month ahead of schedule. The men from San Antonio turned over the task of training the South Vietnamese to contract instructor personnel hired by Lycoming, Inc. and came home.

Sacramento was calling for additional volunteers even as the first groups were preparing to return to the United States. Ultimately, nineteen more SAAMA people volunteered, but in December 1972 AFLC headquarters announced that henceforth civilian specialists needed to support the shops at Bien Hoa would be supplied by contractors; SAAMA's role would be advisory only.

Project ENHANCE PLUS

In October 1972, Kelly began one of its largest projects in support of Vietnamization. Known as ENHANCE PLUS, this project involved extensive logistic support in the transfer of A-37, F-5, and T-38 aircraft--together with spare engines, parts, and

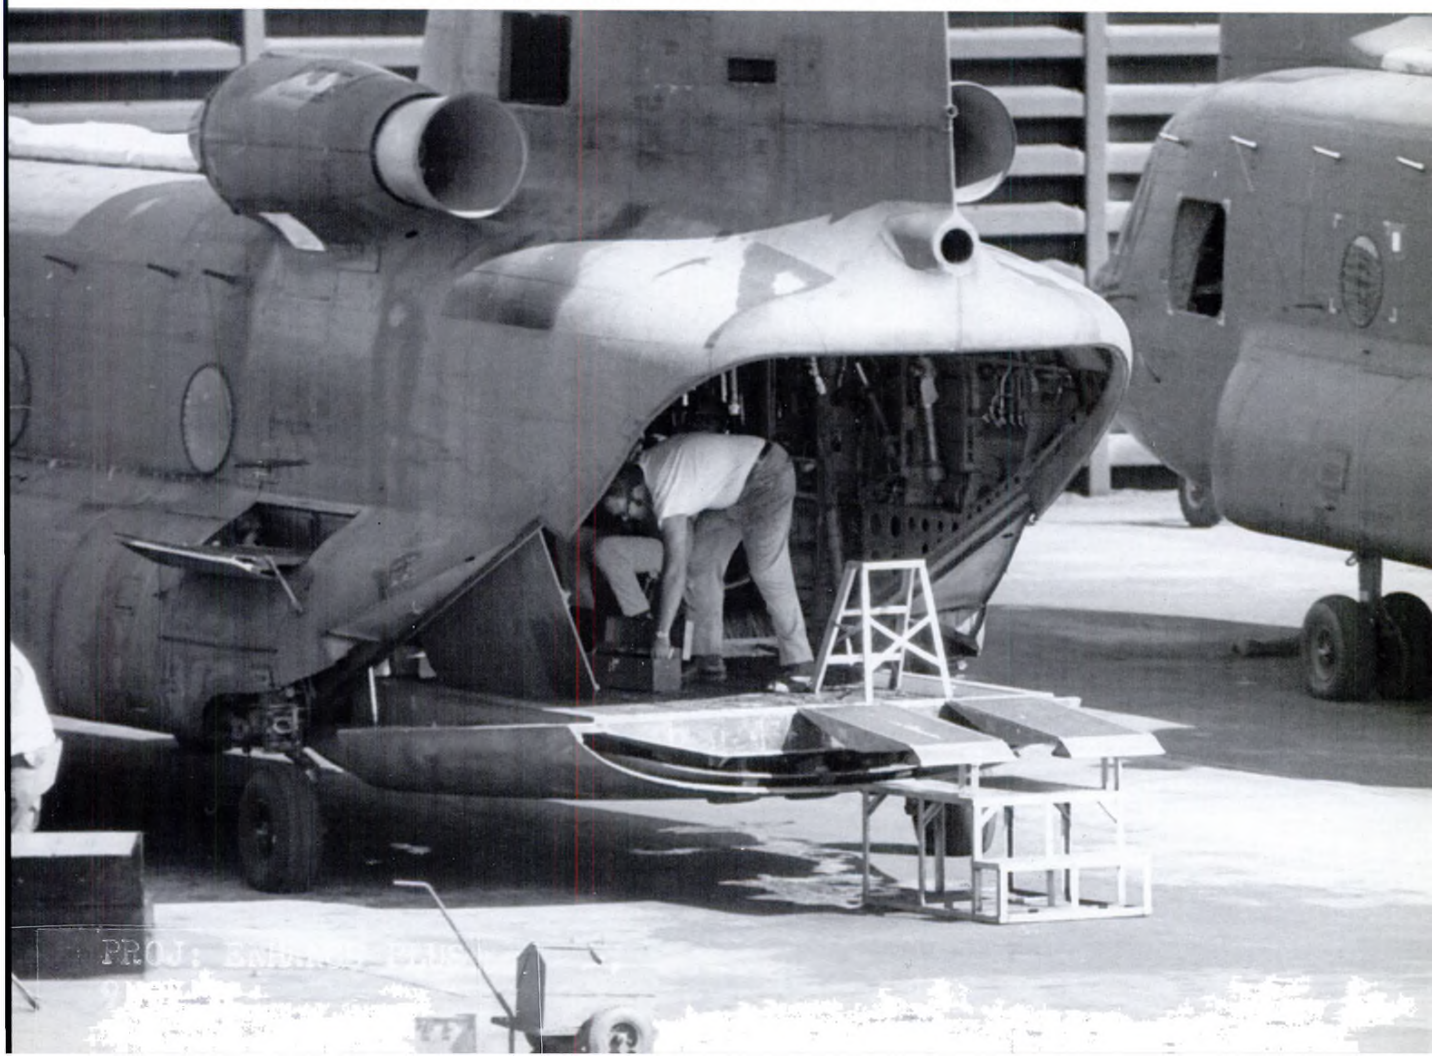

other equipment--from the United States to South Vietnam. The project got underway on October 20, with the first A-37 aircraft arriving on the 28th. Between then and November 4, sixty-six aircraft were disassembled, packed, crated, and shipped aboard C-5 transports to Vietnam. Reports on the progress of the program were sent to AFLC headquarters and the Air Force Chief of Staff every twelve hours. The pace was fast; SAAMA workers averaged less than an hour per aircraft, time from when the first A-37 touched down at Kelly until the last one arrived at Phang Rang Air Base was six days, eleven hours, and fifty-one minutes.

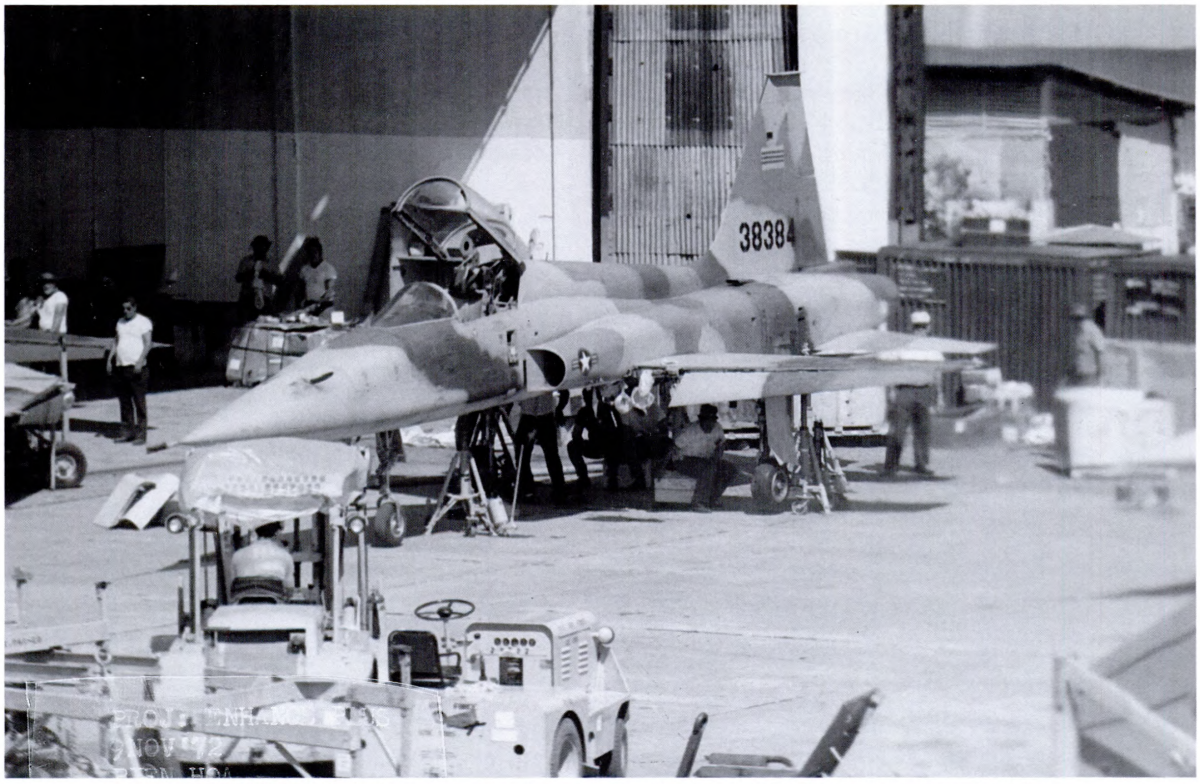

At the same time, 256 SAAMA personnel traveled to Vahdati, Iran, to disassemble, pack, and ship thirty-two F-5 aircraft being transferred from the Iranian Air Force to South Vietnam. The team from Kelly, commanded by Colonel Ralph Dresser, left on the 28th and 29th of October aboard a total of eleven C-141s and three C-5s. One hundred and thirty-eight workers traveled with the F-5s, which began leaving Iran on November 20, to unpack and reassemble the aircraft at Bien Hoa.

Workers at Kelly were scarcely finished sending off the first group of A-37 aircraft when twenty-eight T-38s arrived. These, too, were disassembled, packed, and airlifted by mid-November. In addition, San Antonio shipped 414 engines, taking them from major commands and contract overhaul facilities, and provided between seventy-four and 100 percent of all spares and aerospace ground equipment. The cost of this effort, including overtime, supplies, and all equipment, came to $5,700,000.

Orchestrating this complicated set of tasks was an Augmented Command Post set up in the Operations Hangar (Building 1610). Major General William A. Jack, the SAAMA commander, personally directed the operation which continued around-the-clock. On November 13, five days after the last T-38 was on

Kelly teams also accomplished depot level overhaul of CH-47B helicopters at Bien Hoa.

During ENHANCE PLUS, Kelly personnel set records in shipping A-37, T-38, and F-5 aircraft to Vietnam.

its way to Vietnam, the command post manning was reduced to controllers only (although it continued to operate twenty-four hours-a-day), and it finally shut down on November 18. Kelly set several records while carrying out ENHANCE PLUS. Including all the crated aircraft, the Aerial Port sent out 18.1 million pounds of cargo. At one point, the port crews loaded a C-5 in just twenty-two minutes. Headquarters USAF was impressed enough to acknowledge publically the professionalism, dedication, and ingenuity of the SAAMA work force in rising to the challenge, making ENHANCE PLUS one of the brighter moments in Kelly's long heritage of service.

Operation Homecoming

The final chapter of Kelly's support for the American effort in Southeast Asia was the role played by the base in the welcome home for the American prisoners of war (POWs). Lackland was one of ten Air Force bases selected to receive the newly released POWs, all of whom had first been

Colonel Thomas J. Sterling of Fort Walton Beach, Florida, addresses the well-wishers at Kelly upon his return. He was captured on April 18, 1967.

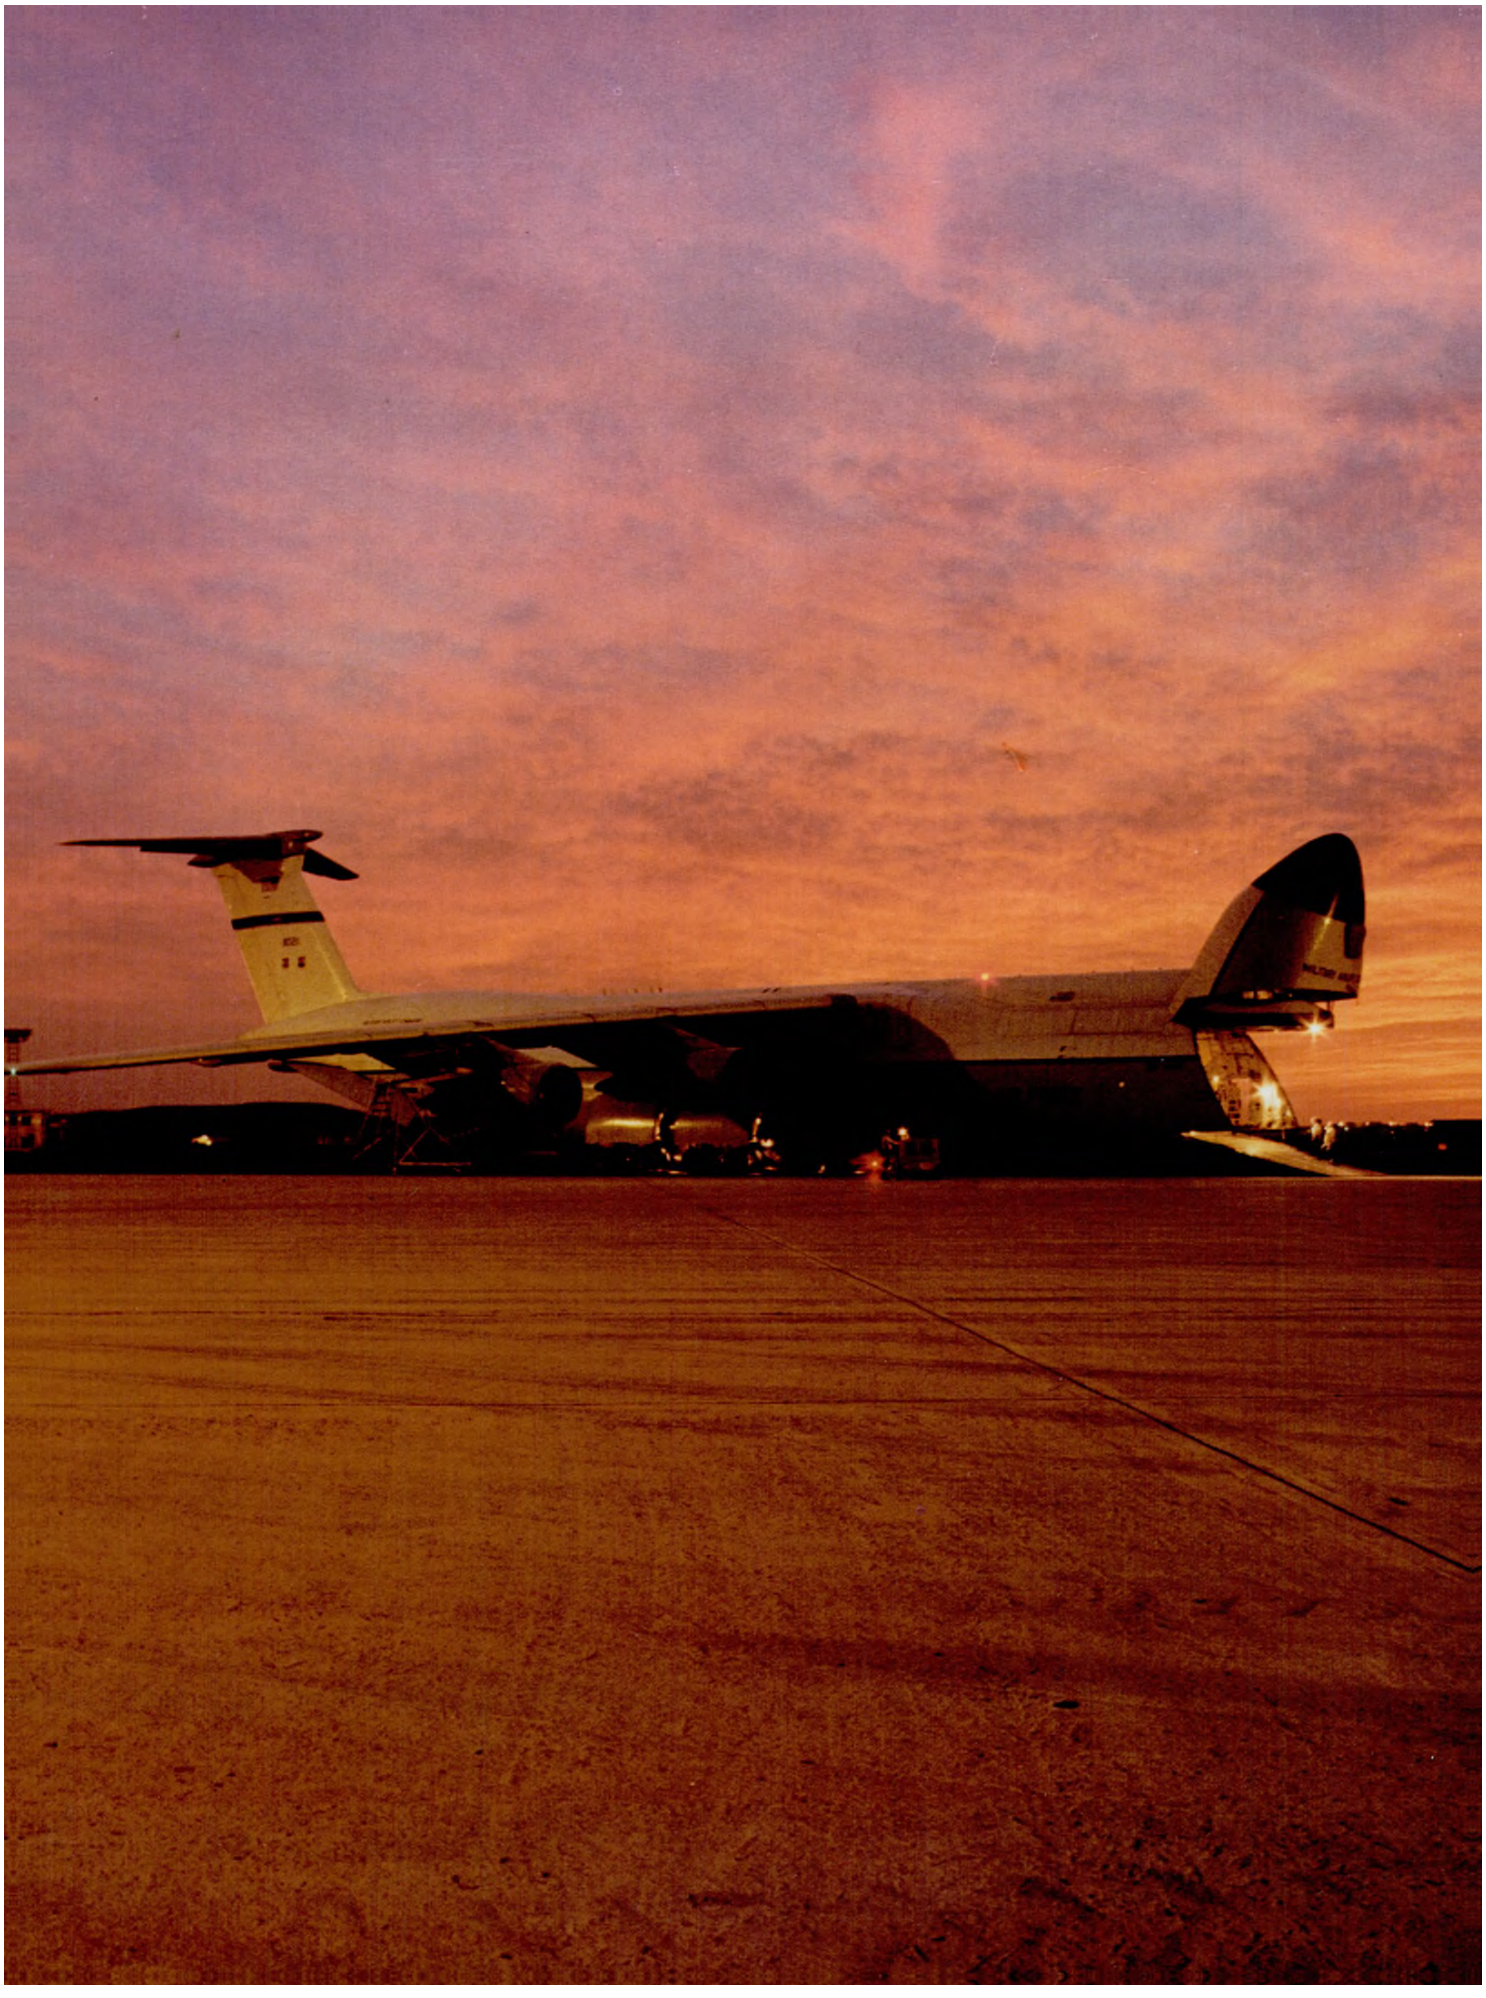

given a medical check-up, new uniforms, and a complete debriefing, along with a brief recuperative stay at the Joint Homecoming Reception Center at Clark Air Base in the Philippines. Fort Sam Houston was selected to serve as one of the Army reception centers because it was the home of the Brooke Army Medical Center. Since neither Lackland or Fort Sam Houston had a runway, Kelly became the initial reception site and the focus of most public attention.

Colonel Joseph H. Wehrle, Director of Plans and Programs at SAAMA, served as the first head of Kelly's reception team. Colonel William MacLachlan, Deputy Base Commander, succeeded him in this role in November 1972.

Kelly's Homecoming Plan was implemented on February 12, 1973. Families of the returning servicemen had been notified earlier, and each had a Personal Assistance Officer assigned to make sure that no questions went unanswered or need unfulfilled. To ensure that the ceremony would be as private and personal as possible, the public was excluded, but Kelly workers and their families were invited to the flight line for weekend arrivals. The first Homecoming flight arrived on February 15, 1973. Ten more flights followed, bringing home twenty Air Force and twelve Army servicemen to an emotional welcome.

Flights bringing former POWs to Kelly began arriving on February 12, 1973. Crowds of sightseers were kept to a minimum, but the excited family members made each arrival a festive occasion.

CHAPTER SEVEN

Shifting Priorities

Even though fighting in Southeast Asia continued during the first few years of the decade, by 1970 the focus of military priorities was already shifting. During the ensuing decade, the United States Air Force -- indeed, the entire Department of Defense -- found itself "doing more with less." Not since 1945 had the military seen its budget and personnel strength slashed so quickly. As the Assistant Vice Chief of Staff of the Air Force said in September 1970, the Air Force was faced with the "unenviable task of minimizing the impact of what could be the most drastic personnel upheaval since the end of World War II."

After over eight years of fighting in Vietnam, the mood of the American people was decidedly anti-military. Rampant inflation, economic stagnation, and the absence of a clear military threat convinced national leaders that the defense budget could be cut drastically to pay for expanded social programs. This all combined to make the defense budget in the "me generation" decade one of the leanest in thirty years. As funding dropped, inflation doubled the price of everything. Costs for manpower, material, and energy skyrocketed. One of the biggest challenges facing Air Force Logistics Command (AFLC) was maintaining an acceptable level of logistical support as defense planners cut supply and maintenance funding to funnel more of the scarce resources into weapon system acquisition. With support cut to the bone, the Air Force of the 1970s came close to becoming a "hollow" force.

Retrenchment and Compression

The Air Force tried a variety of things to match its resources with its mission. One was the reduction of the number of bases worldwide. Unlike the rest of the Air Force, AFLC was spared the wrenching trauma of closing facilities in the 1970s; it already had gone through that in the mid-1960s, when it went from nine to five Air Materiel Areas (AMAs). Another simple way to reduce costs was to cut manpower, and the entire Air Force suffered from arbitrary personnel reductions. As part of this retrenchment, the Air Staff looked at programs to eliminate for manpower and monetary savings. One of these reviews was Project 703, Force Structure Program Analysis, which included the phase-out of the B-58 "Hustler," acceleration of F-102 reclamation, inactivation of the 19th Military Airlift Squadron, and a ten percent decrease in leased communications service. All of these initiatives reduced San Antonio Air Materiel Area's (SAAMA) personnel strength. Another review evolved from Defense Department and congressional interest in the costs associated with operating intermediate headquarters. To absorb the resulting Air Force-wide manpower cuts at the numbered air force-level, organizations were either eliminated or transferred. At Kelly, effective July 1, 1972, the Comptroller, Personnel and Office of Information functions transferred out of the air materiel area and into the air base group.

As operations in the post-Vietnam era scaled down, personnel costs moved up and funding plummeted. San Antonio AMA's budget paid for fewer and fewer people. The previous four-year, upward trend in manpower authorizations came to a crashing halt in fiscal year 1970. Between 1970 and 1976, SAAMA lost over 8,000 positions as its total authorized strength reached its lowest level since 1950. Kelly officials dealt with this personnel turbulence the best they could. To ensure SAAMA met these fiscally driven manpower ceilings, they curtailed hiring, restricted filling vacancies, terminated temporary employees, and encouraged retirements. Congress helped by providing various retirement incentives, including substantial cost of living increases and liberal changes in computing retirement annuities.

Optional retirement benefits were made more attractive, too, as a variety of new programs were set up to entice eligible workers to retire. These ranged from a "discontinued service" retirement (when employees were involuntarily separated from their jobs for reasons not related to misconduct or delinquency) to "trial retirements." In February 1970, AFLC announced employees eligible for optional retirements could try retired life; if they were not happy, they would be rehired within the first year. This program, however, did not live up to AFLC's expectations. Only six SAAMA employees took advantage of trial retirements before Headquarters AFLC discontinued the program in July 1974. On

Part of the Kelly work force leaves for home.

June 12, 1973, the President signed an "early out" retirement plan into public law, which permitted early optional retirement for employees of agencies undergoing a major reduction-in-force (RIF). This proved more popular; during the new program's first year, 212 SAAMA employees took an "early out" and retired.

As the federal budget continued its decline, officials sought other ways to cut payroll costs. On August 5, 1971, the Office of Budget Management established a government-wide initiative to lower the average federal grade by two tenths of a percent. To meet SAAMA's goal, a committee put together a grade roll-back plan, which looked at organizations, position structure, and span of control with an eye toward eliminating supervisor layering, filling positions at the lowest possible level, and consolidating organizations. In 1971, SAAMA's baseline grade average was 7.6744. By the end of June 1974, SAAMA's average GS, or General Schedule, level was 7.4347 (.0397 lower than its goal of 7.4744).

Although SAAMA had been forced to cut over 6,000 authorizations between fiscal year 1970 and fiscal year 1975, it actually had separated only thirty-seven people, and all but two of them had been placed in federal jobs in the San Antonio area. But the reductions that came in 1976 were different; this cut prompted Kelly's first major RIF in over ten years. The Civilian Personnel Office processed over 3,000 personnel actions, which lead to 792 people being placed in lower grade positions and 733 actual separations. After this, the massive cuts stopped, and authorizations remained relatively stable for the rest of the decade.

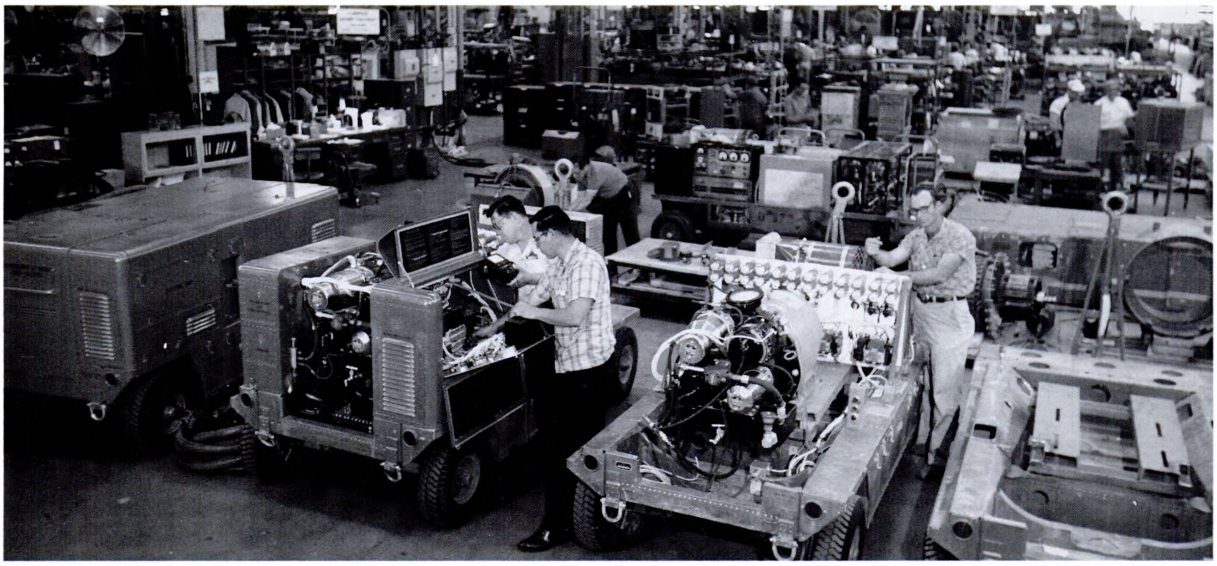

Streamlining the Structure

Technology Repair Centers

On April 17, 1973, the Office of the Secretary of the Air Force announced closure or work load realignments at fourteen Air Force bases because of the draw down of American operations in Southeast Asia. Reductions in the Air Force aircraft inventory and diminished depot level maintenance requirements also contributed to the draw down. At the end of World War II and the Korean War, AFLC's predecessor closed facilities to save money. Air Force Logistics Command did not have that luxury at the end of hostilities in Vietnam. The command already was down to five AMAs, the minimum number deemed necessary to maintain optimum mobilization capability. Consequently, command leaders had to find other ways to reduce expenditures.

As part of this search, AFLC leaders devised the Technology Repair Center (TRC) concept, an innovative approach to maintenance management. Goals of the TRC concept included improving Maintenance's organizational structure, reducing overhead management, increasing the use of industrial facilities, balancing work loads, and simplifying work load assignments. The impetus came from a 1971 Department of Defense directive which required that no more than seventy percent of the maintenance essential to the Air Force mission should be done by military depots. Furthermore, the directive stated that depots should operate at least at eighty-five percent capacity.

The TRC concept called for each depot to maintain items with similar technical characteristics, requiring like skills, facilities, tools, and test equipment. Some 300 types of items were grouped into eighteen

Under the Technology Repair Center concept, SA-ALC had responsibility for maintenance of a number of items, including aerospace ground equipment.

technologies (munitions, avionics, missiles, landing gear, etc.). These included support items known as "exchangeables" but excluded, at least initially, aircraft and engine components. Specialized repair of these items comprised about one-third of the total projected organic, or in-house, work load. The command added aircraft and engine components to the list of technologies in fiscal year 1974. Establishment of the TRCs involved transfer only of repair responsibility, not management.

PACER TORCH, the project name for TRC implementation, began in January 1974 and continued for two years until the TRC plan was completed at all five centers. When fully implemented, more than 9,300 kinds of items and 6.2 million man-hours of work had been shifted among the air logistics centers (ALCs). (On April 1, 1974, AFLC redesignated the air materiel areas as air logistics centers.) Sacramento and Warner Robins ALCs gained in terms of work load while San Antonio and Oklahoma City ALCs lost. Ogden ALC's work load remained about the same.

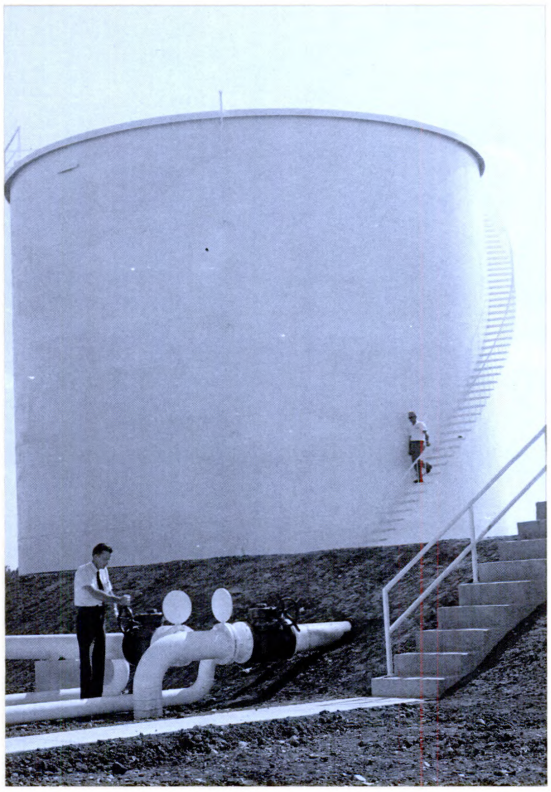

San Antonio ALC assumed responsibility for Electrical Aerospace Ground Equipment (AGE), Electrical/Mechanical AGE, and nuclear components. It transferred 1.6 million direct product actual hours of work, picking up only 132 thousand hours in new work load. Kelly lost a total of 981 authorizations (117 in fiscal year 1974, 425 in fiscal year 1975, and 439 in 1976) as a result of the work load transfer. Despite the cost and personnel turbulence involved with implementing PACER TORCH, by 1975 AFLC achieved its goal of streamlining operations and balancing maintenance work loads among its five ALCs.

Remodeling System Manager/Item Manager System Responsibilities

Faced with additional manpower cuts over the next three years, Headquarters AFLC looked to reorganize the existing materiel management structure to support the Air Force mission of the future with a minimum of resources. After a year's review, AFLC officials announced on December 4, 1975, that the ALCs would implement the "system manager/item manager" reorganization, nicknamed PACER FLARE, to reduce the cost of the materiel management function by consolidating, merging, and centralizing.

The reorganization took item management responsibilities out of the system management divisions, allowing the system manager to concentrate on customer support. The item manager assumed full responsibility for supporting all items for both the customer and the system manager. This separation of duties allowed additional consolidation of homogeneous items, enabling AFLC to assign more items of a like type to each manager.

Sorry, Out of Gas!

For over thirty years, the industrial nations of the world had been using fossil fuels as if they came from a bottomless pit. This came to a screeching halt in the early 1970s as gluttonous consumption, panic buying, and a crisis in the Middle East dried up most of the world's stored petroleum reserves.

In November 1972, San Antonio's City Public Service Board (CPSB) began experiencing intermittent curtailments in its shipments of natural gas used to generate the city's electricity. By May 1973, continued shortages forced CPSB to use fuel oil, which was four times as expensive, to generate electricity. On May 22, CPSB officials asked Kelly to reduce its consumption of electricity. The next day, Major General William A. Jack, San Antonio Air Materiel Area Commander, implemented a variety of initiatives to reduce energy consumption--electric light intensity was reduced by half, thermostats raised, night-time recreational events cancelled, etc. In the Maintenance area, mechanics used aircraft power generators only when working on aircraft interiors, and pre- and post-flight checks were rescheduled for daylight hours only. Separately, these actions seemed insignificant, but when put together, Kelly's use of electricity declined two percent despite a 15.3 percent increase in the electrical load. Kelly's energy conservation program, and indeed that of the entire Air Force, shifted from reducing costs to conservation of dwindling natural resources.

These shortages extended to aviation and motor gas, too. In May 1973, Kelly's base service station shortened its hours of operation when the monthly gas supply was cut by fifty-five percent.

Within a year, people authorized to use the base service station could only buy ten gallons of gas at a time. In addition, use of government vehicles was curtailed whenever possible, daily mail deliveries were reduced, and trips moving supplies were consolidated.

But the energy shortage got even worse. On October 6, 1973 Egyptian tanks crossed into the Israeli-occupied Sinai Peninsula, setting off yet another Middle East conflict with the Soviet Union on the side of the Arabs and the United States supporting the Israelis. This time, however, American aid to Israel cost her dearly as the Arabs' immediately stopped the flow of their crude oil to any nation that showed support for the Israeli cause. The world's petroleum headache turned into a migraine. People found themselves in the Organizaton of Petroleum Exporting Countries gas line and paying dearly for the privilege.

President Richard Nixon called for an immediate seven percent decrease in energy usage by all federal activities. The Air Force and Air Force Logistics Command aimed at a ten percent reduction, while the San Antonio Air Materiel Area set its own goal of reducing electrical consumption by thirty percent. Kelly's people continued the initiatives begun earlier and took even more. Teams conducted spot inspections to see if thermostats were set at the proper settings and lights turned off when not in use. The Directorate of Maintenance shut down during the Christmas holidays, December 23 to January 1, saving $76,000.

The fuel shortage caused the Directorate of Aerospace Fuels special problems. Responsible for acquisition of aviation gas for the Air Force, directorate personnel found themselves scrambling to fill the service's requirements for JP-4 jet fuel. By the end of December 1973, they only had offers for sixty-one percent of the forty-five million barrels needed for fiscal year 1974. These shortages continued for several years until the oil reserves slowly built back up. Gradually things calmed down; gas lines faded and people became accustomed to paying higher utility bills. But never again did the industrial nations take energy for granted.

Reorganization of item management responsibilities changed the look of the Directorate of Materiel Management.

Despite reduced manpower and funding, Headquarters AFLC wanted to retain an integrated, five ALC structure with each having four prime missions (depot maintenance, distribution, procurement, and materiel management). Command officials hoped restructuring the ALCs' Directorates of Materiel Management would help them do this. In a further effort to centralize and save scarce resources, AFLC leaders wanted to identify those things that could be done outside the ALC Materiel Management organization. They assigned the ALCs' cataloguing and standardization functions to the Defense Logistics Service Center at Battle Creek, Michigan, and centralized the equipment and allowance functions at Warner Robins ALC, Georgia. Air Force Logistics Command's international logistics program went to the 2763rd Supply Squadron at Wright-Patterson AFB, Ohio. San Antonio ALC gave up 262 authorizations in these "stand-alone" transfers.

As its contribution toward bringing AFLC's expenditures in line with its budget -- a major goal of the realignment -- SAAMA's Materiel Management Directorate lost another 303 authorizations. Actual movement of people and equipment began on April 16, 1976, and the reorganization was complete two months later on June 19. These losses, along with other programmed reductions, led to SA-ALC's first real RIF in over ten years.

Depot Modernization

Although budgets were tight in the 1970s, capital improvements postponed during the height of Vietnam finally came to the top of the priority list. And just in time. Most of the command's depot facilities were too small and out-of-date technologically. Over seventy percent of AFLC's industrial plant dated from the 1940s. Many of Kelly's maintenance buildings dated from the 1920s and 1930s; some were even built in 1917 and 1918. Warehouses were crowded, and a lack of sufficient covered storage space forced material and equipment to be kept outside, causing thousands of dollars worth of weather damage each year.

Command leaders rightfully believed that a five-year plan of construction projects for all the ALCs would have a better chance at funding than entering them piecemeal through the military construction budget process. Congress approved AFLC's Depot Plant Modernization Program, which began in fiscal year 1972. Over the next seven years new warehouses, materiel processing facilities, and maintenance buildings gradually replaced many of the antiquated structures across the command.

Construction of these new facilities on Kelly augmented and expanded SA-ALC's role as a vital logistics center. One of the more significant projects was

the Jet Engine Overhaul Facility, building 360, completed on May 4, 1974. The $12.55 million, U-shaped structure provided 543,650 square-feet of space for a continuous flow of engine components from engine disassembly to reassembly and shipment. On June 30, 1975, SA-ALC accepted the new $3.07 million Plating Shop, building 301, which consolidated all plating operations under one roof. Construction of a new precision measurement equipment laboratory began on May 2, 1974. This facility, building 300, provided repair, calibration, and certification of precision measurement equipment requiring use of laboratory standards under closely controlled environmental conditions. The 39,900 square-foot building was completed on October 21, 1975, at a cost of $1.79 million.

Building 301, the new Plating shop.

First used in April 1980, the 26,677 square-foot Aircraft Engine Fuel Accessories Repair and Test Shop was one of the most valuable, at $9.9 million, and modern facility in the Maintenance area. Technicians in building 348 overhauled and tested the F100 unified fuel control system as well as the jet engine fuel control systems for the T56, J79, and TF39 engines.

The new Aircraft Engine Fuel Accessories Repair and Test Facility, building 348, cost $9.9 million.

The command's Depot Plant Modernization Program added several state-of-the-art storage facilities to Kelly's list of buildings, allowing SA-ALC to consolidate storage facilities on main Kelly and eliminated the need for the San Antonio Air Force Station, nine miles away, as a materiel storage site.

Kelly's new Jet Engine Overhaul Facility, building 360.

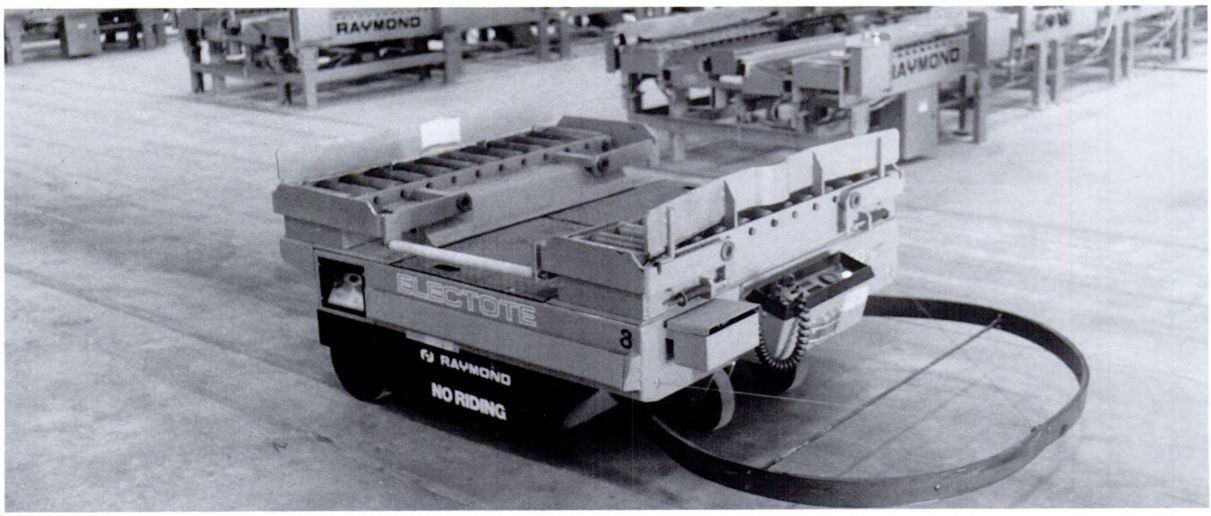

The Logistics Material Processing Facility, building 1537, was completed on June 15, 1974.

Furthermore, East Kelly's warehouses and storage yards, two miles from central receiving operations, were no longer required.

The Logistics Material Processing Facility, building 1537, centralized all receiving and shipping functions in one building. Completed on June 15, 1974, the $4.65 million facility contained a processing area, an administration center, a restaurant, and rail and truck docks. It was AFLC's first completely integrated receiving, packaging, and shipping facility. The new Hazardous Material Warehouse, building 1575, was completed on October 22, 1975, at a cost of $597 thousand. Planners designed the warehouse to provide safe storage space for flammable liquids and chemicals.

The Distribution area benefitted from another new facility, building 1538. The directorate took beneficial occupancy of this semi-bulk item warehouse on October 20, 1976, but did not begin operations until November 1977. Costing $7.9 million, the L-shaped building had 487,280 square-feet of storage space and replaced all the storage facilities on East Kelly. Building 1536, the bulk item warehouse, was completed in January 1980 at a cost of $6.9 million for the structure and $2.1 million for the mechanized material handling system. This machinery automatically transported material into and out of storage with a minimum of labor, doing the job faster and more economically than the human hands it replaced.

New mechanized material handling systems moved supplies in storage fast and efficiently.

Kelly mechanics worked twenty-four hours a day to keep C-5s flying during PROJECT NICKEL GRASS.

PROJECT NICKEL GRASS

While Israelis observed Yom Kippur on October 6, 1973, Egyptian soldiers crossed the Suez Canal, advancing into the Israeli occupied Sinai Peninsula. Syria subsequently attacked the Golan Heights on Israel's northern border, and the Middle East was at war again. The United States immediately began sending materiel to Israel in an effort to counter the massive Soviet arms shipments to Syria. PROJECT NICKEL GRASS was the code name for the delivery of war materials to those military bases designated as accumulation points for airlift to Israel. San Antonio Air Materiel Area became active in PROJECT NICKEL GRASS on October 9, 1973.

Kelly's Operations Center and the Directorates of Materiel Management, Distribution, and Maintenance were staffed for continuous duty, and personnel manned emergency operations centers to provide timely support. Directorate of Aerospace Fuels went on extended duty hours and the Logistics Readiness Center was activated in building 1680.

To maintain C-5 aircraft during the airlift, SA-ALC Maintenance personnel worked twenty-four hours a day to repair items that Military Airlift Command identified as critical. Maintenance workers refurbished gear boxes, fuel controls, generators, and oscilloscopes used in the airlift.

Directorate of Distribution supplied, packaged, and loaded more than a thousand items requested by the Air Force, including runway lighting fixtures, test stands, various gas turbines, J69 engines, and aircraft maintenance equipment. In addition, San Antonio Air Materiel Area supplied two seven-man loading teams to Wright-Patterson Air Force Base, Ohio, to support airlift operations.

San Antonio Air Materiel Area shipped 1,424 items for Israel, produced 1,308 support items, and worked 66,083 overtime hours. The approximate cost of PROJECT NICKLE GRASS was $848,200.

Organizational Changes

As SAAMA moved into the 1970s, the larger directorates remained essentially the same, although some went through a variety of name changes. On October 9, 1969, the Directorate of Air Force Aerospace Fuels dropped the "Air Force" from its name to eliminate organizational confusion. It remained the Directorate of Aerospace Fuels until August 1, 1975, when it again changed names, becoming the Directorate of Energy Management, reflecting a shift away from commodity orientation to functional operations. (Interestingly enough, the fuels organization reverted to its old name, the Directorate of Aerospace Fuels, again on December 1, 1988.) Another organization changed its name on January 1, 1970, when the Directorate of Supply and Transportation became the Directorate of Distribution. Eight years later, on December 1, 1978, the Directorate of Procurement and Production became the Directorate of Contracting and Manufacturing.

But besides these name changes, forces outside SAAMA and the Air Force prompted restructuring and creation of new organizations. Manpower reductions and grade roll-backs brought on by smaller budgets and a downsized force accounted for many of the division-level reorganizations, including those involved in the Technology Repair Concept and Item Management restructuring. But personnel problems of the Vietnam era and later--racial strife, the use of drugs, and alcohol abuse--spawned other new organizations as the Air Force sought for ways of dealing with these issues and the effect they had on the military and civilian work force.

Fernando Villasana (Chief, Equal Employment Opportunity Counselor), James Goode (Director of the Air Force EEO Program), and Zella Rainey (Federal Women's Program Manager), congratulate Major General William H. Reddell as he receives the first Distinguished Equal Employment Opportunity Award.

Racial tension reached the boiling point in the United States in the 1960s, and while the inner cities of Los Angeles and Detroit burned, Kelly simmered. San Antonio--and Kelly--Hispanics began organizing during this time to turn into reality the promises of the Civil Rights Act of 1964 and the subsequent Executive Orders that implemented the act. Equal employment opportunity (EEO) at Kelly, with over half of SAAMA's civilians Hispanic and most of them in lower grade positions, often turned into a matter of heated--and public--debate. At the invitation of several SAAMA Hispanics, civil rights commissioners held hearings at Kelly in the late 1960s. These hearings, hard-hitting newspaper articles, letters to congressmen, and a responsive commander helped break down barriers for Kelly's people.

Major General William H. Reddell came to Kelly in April 1969 with orders to fix "Kelly's people problems." One of the first things he did was to set up a community council consisting of Kelly union officials, SAAMA managers, and San Antonio clergy and business leaders. General Reddell took another step forward when he implemented new government-wide discrimination complaint procedures on July 1, 1969, by establishing the Special Assistant to the Commander for Equal Employment Opportunity, a manager who worked directly for the commander. For the first time, people not under the jurisdiction of the organization concerned investigated complaints. On September 14, he appointed Fernando Villasana to serve as SAAMA's first full-time EEO counselor. These initial efforts were so successful that General Reddell received the first Air Force Distinguished Equal Opportunity Award in September 1971. While discrimination did not end overnight, the EEO program at Kelly has made great strides over the last twenty-two years.

The Air Force hoped racial strife and drug abuse could be corrected through education or rehabilitation and established new organizations to provide this training. On November 10, 1971, Kelly opened a new Social Actions division within the Directorate of Personnel. This was elevated to a staff office, reporting directly to the commander, on April 10, 1972, to show the high degree of interest in Air Force "people problems." Social Actions personnel implemented all Air Force plans and policies relating to drug and alcohol education, race relations, and equal opportunity and treatment for military personnel.

Reflecting increased congressional interest in the military's efforts to encourage small businesses,

SAAMA separated the Small Business and Contractor Relations Office from the Directorate of Procurement and Production on August 5, 1971, and established it as a staff office reporting directly to the commander to emphasize the military's small business effort, which had declined in the 1960s.

The San Antonio Air Logistics Center

An end of an era in Kelly's history came on April 1, 1974, when Headquarters AFLC redesignated the air materiel areas as air logistics centers. General Jack Catton, AFLC Commander, believed the new name more accurately reflected the increased responsibilities carried out by the centers. After twenty-eight years, the San Antonio Air Materiel Area became the San Antonio Air Logistics Center (SA-ALC).

Quality Programs

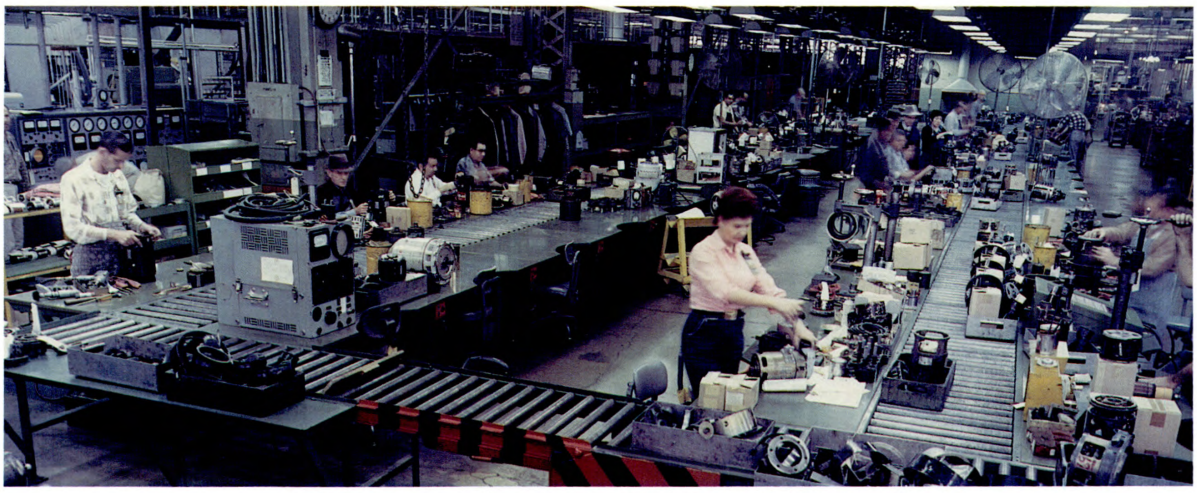

Kellyites have always taken great pride in the quality of work they produce, but it can not be left to chance. For the first thirty years, inspectors tried to ensure products leaving Kelly shops were free of defects. But inspectors standing by to check each item as it rolled off the production line was too manpower intensive and time-consuming. Consequently, in the early 1950s, Air Materiel Command and SAAMA officials turned to private industry to see what it was doing to enhance the quality of its products.

After much study, Kelly's Directorate of Maintenance introduced a "new and effective tool for the guidance and improvement of production--Quality Control." While at first glance it appeared to be an updated version of the earlier inspection program, the driving force behind Quality Control was not finding defective products through inspection, but interest in the control of processes and machines so that production met certain standards. Quality could not be inspected into a product; it had to be built into it. Central to this new approach was the relatively new science of statistical quality control, a technique used to organize inspection results to reflect the normal capabilities of the process. In 1951, Maintenance officials established a team within the Production Inspection Section to implement the new program.

Continued interest in quality improvement caused AMC officials to create a comprehensive quality control program at both the headquarters and the AMAs. On November 1, 1953, SAAMA established an Assistant to the Commander for Quality Control (changed to Quality Control Office on February 2, 1955) to ensure an efficient quality assurance program within the AMA.

While the philosophy of quality control expanded during the subsequent years, going from a narrow definition of conformance of a product to certain specifications to encompass reliability of requirements to ensure supportability, transportability, and maintainability, its organization got smaller. Budget cuts in the early 1960s caused Headquarters AFLC to discontinue the Quality Control Offices at the AMAs, and on January 1, 1962, SAAMA decentralized its quality control responsibilities. Materiel Management established a Quality Control Branch, joining the other major organizations which already had quality control functions.

Kelly's program remained decentralized for the next ten years, until Headquarters AFLC once again decided to centralize. On January 1, 1975, SA-ALC established the position of the Special Assistant to the Commander for Quality Assurance to serve as a coordinator and adviser for the ALC's quality efforts and to act as a focal point for complaints from the using commands.

Kelly workers have always been proud of the quality of their work.

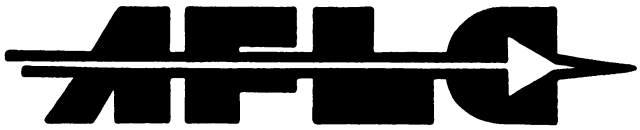

This office lasted another ten years before budget constraints forced AFLC to look for manpower savings, and once again the quality assurance function was a prime target for elimination. In 1986, AFLC leaders approved decentralization of the command's quality assurance organizations. At SA-ALC, this meant closing the quality assurance office and dividing its reduced manpower authorizations among the directorates. The center also established a Quality Council with a new position in the Inspector General's office to serve as focal point.

But things never remain static for long. In August 1987, AFLC's new commander, General Alfred G. Hansen, astonished the command by reemphasizing the values of centralization. At a December 1987 Quality Council meeting, General Hansen stated, "The time has come for us to shift our emphasis away from evaluating the goods and services we provide at the end of the process...and toward the process itself by which goods and services are actually provided." Although this idea was over thirty years old, General Hansen's interest caused a dramatic shift in AFLC's quality philosophy. The new command quality effort represented a change in culture; quality was now everyone's business. Allegiance to quality started in the commander's office and "cascaded" down to every person in the command.

Looking for a way to summarize the main points of the new process-oriented program, General Hansen came up with the idea of QP4--Quality = People + Process + Performance + Product. To facilitate the command's march toward quality, General Hansen reestablished the position of Assistant to the Commander for Quality Programs at the headquarters and directed the ALCs to set up equivalent offices; SA-ALC's new quality organization opened in January 1988. To be effective, the new command philosophy could not be regulated. Instead, AFLC's Assistant for Quality published a "Quality Bill of Rights" to help the command's workers realize they were an essential part of the quality program.

But AFLC was not alone in its push toward quality. Faced with declining budgets and embarrassed by an inefficient, uncoordinated acquisition system, the Defense Department embarked upon a master plan for improved quality entitled Total Quality Management (TQM). Very quickly TQM subsumed AFLC's program, since much of QP4 was an integral part of the larger plan. Cascading, personal responsibility, process awareness, and customer orientation were the pillars upon which TQM (and QP4) was built.

Total Quality Management revolutionized the ways in which SA-ALC, and indeed all AFLC, workers viewed their jobs. Although they took to the new ideas slowly at first, once they saw TQM was not just another "fad," Kellyites embraced the challenge of taking greater responsibility for the quality of their work. Their commitment to continuous process improvement was real. Although AFLC's revised quality program was relatively new, the command won the President's Award for Quality for 1991. San Antonio shared in that honor and also was one of the winners of the 1991 AFLC Quality Improvement Prototype Award. But the real winner of the command's quality program was the United States Air Force with the improved levels of excellence of AFLC products and services.

AIR FORCE LOGISTICS COMMAND

QP4 = PEOPLE, PROCESS, PERFORMANCE AND PRODUCT

QUALITY BILL OF RIGHTS

This document supports the creation of an environment of trust throughout AFLC. It encourages each member of the Command to initiate responsible actions that will contribute to safety, quality and productivity. The sensible exercise of these rights will result in improved products and services. Each member of the Air Force Logistics Command shall have the following Quality **RIGHTS:**

- The **RIGHT** to challenge business as usual
- The **RIGHT** to be heard
- The **RIGHT** to expect commitment to quality
- The **RIGHT** to place quality before production
- The **RIGHT** to feel genuine pride in AFLC products and services

AFLCVA 190-32
March 1991

Fly Me to the Moon

When John Kennedy became President in 1961, one of his goals was the revitalization of America's space program. This effort culminated on July 20, 1969, as Astronaut Neil Armstrong became the first man on the moon. Kelly people shared in this glory.

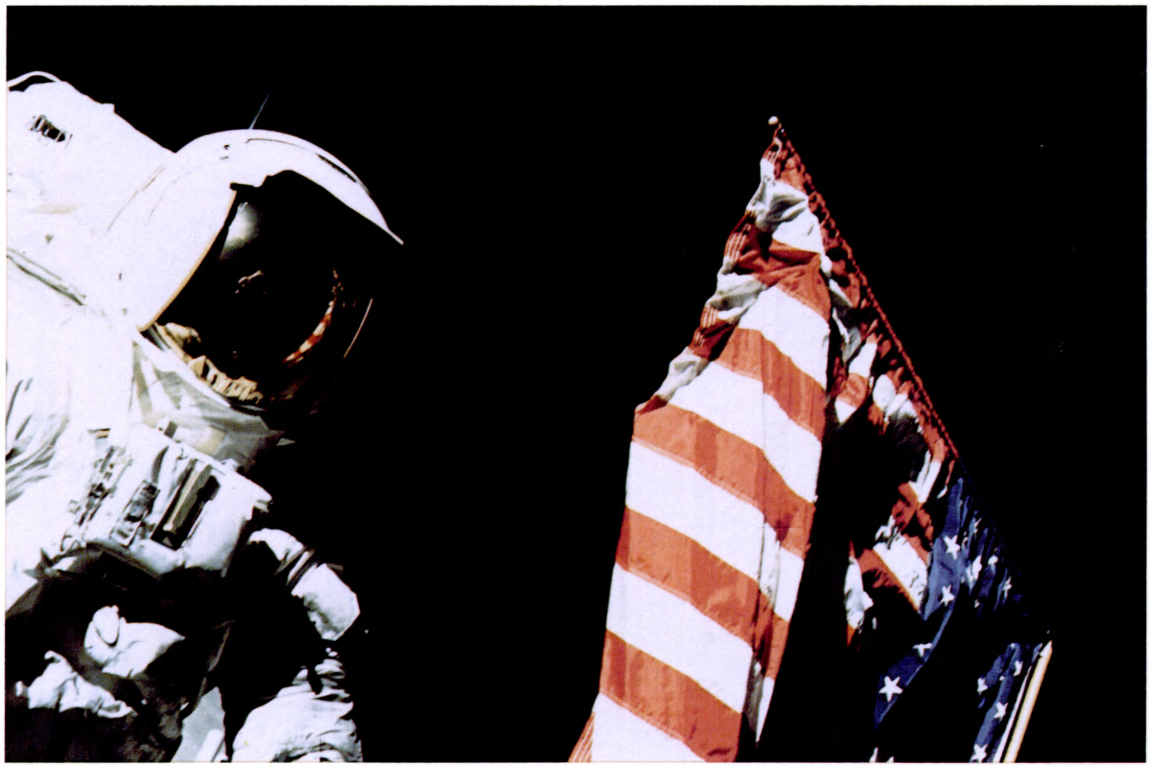

In 1964, Kelly Maintenance workers built three Apollo capsule trainers for the National Aeronautics and Space Administration (NASA). Engineers used the first trainer to provide flotation data in training people to recover astronauts at sea. Astronauts themselves practiced emergency egress procedures in the second trainer, simulating sea recovery in a large tank full of water. The third was used in acoustical research to control and abate noise within manned spacecraft.

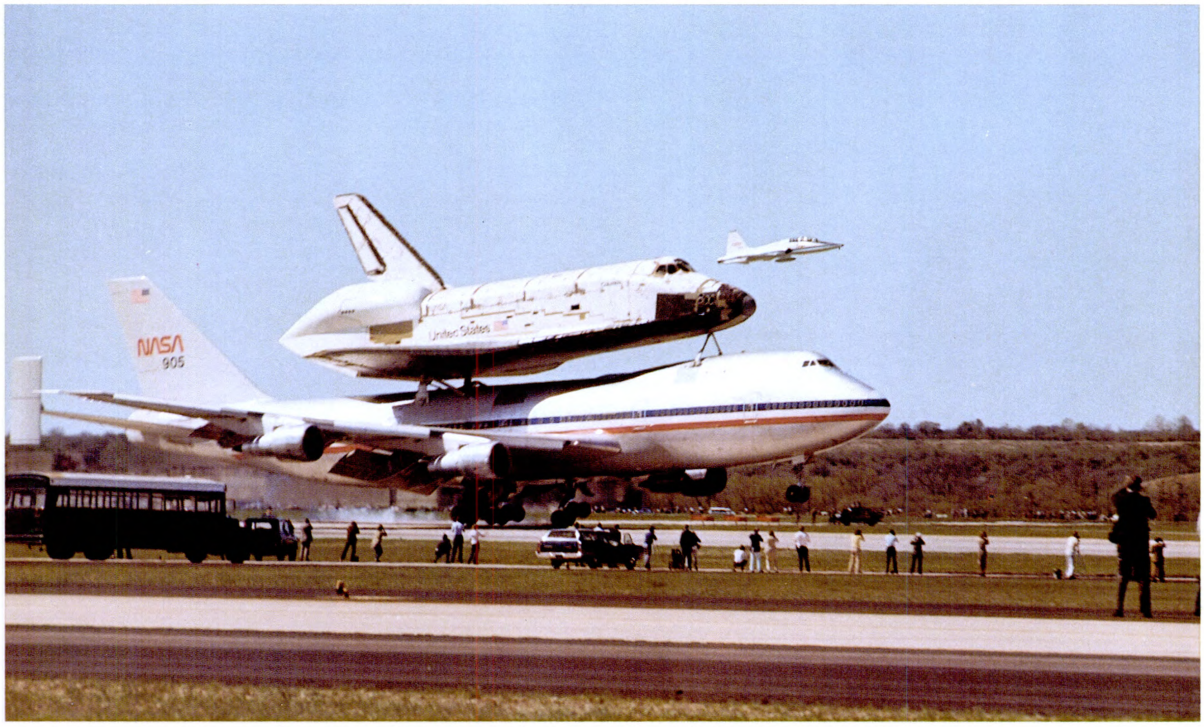

During 1965, Kelly technicians built a human transverse "G" (or gravity) couch for the United States Air Force School of Aerospace Medicine at Brooks Air Force Base, Texas. Astronauts and research pilots used the couch during centrifuge testing to determine the degree of response and tolerance to various acceleration forces. Scientists also used another couch Kelly workers made for animals for research in predicting the effects of sustained or high "G" forces on human cardiorespiratory systems.

Air Force Logistics Command technicians put the finishing touches on one of three Apollo capsule trainers built for the National Aeronautics and Space Administration.

Photo Below: Kelly people were justifiably proud of the contributions they made to get a man on the moon.

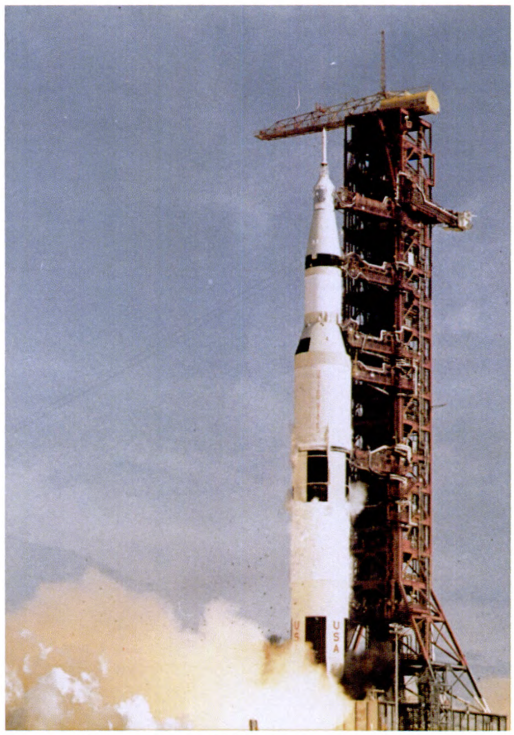

A space shuttle piggy-back on its mother ship touches down at Kelly.

Kelly's Directorate of Aerospace Fuels has supplied propellants and pressurants for NASA since July 1966. Fuels personnel supported all seventeen Apollo launches. For Apollo 11, for example, 1,680 tons of liquid oxygen and 1,220 tons of liquid nitrogen arrived at the Kennedy Space Center in Florida between June 26 and July 16, 1969. One day after the launch, 4,703 tons of liquid oxygen and 1,355 tons of liquid nitrogen were in storage tanks at the space center. Approximately $350 thousand of San Antonio Air Materiel Area supplied fuels and pressurants were used to get Neil Armstrong on the moon.

While the Apollo program ended with the launch of Apollo 17 on December 6, 1972, Aerospace Fuels support of America's space program continued, turning to Skylab, the country's first orbiting space station, launched on May 14, 1973. Kelly's support was similar to that provided during the Apollo program; Aerospace Fuels personnel were at the space center to coordinate propellant loading and were available in case any problems developed in the delivery of the needed pressurants and propellants.

On March 22, 1979, thousands of people lined the roads adjacent to Kelly's runways to catch a glimpse of the space shuttle "Columbia," perched atop its Boeing 747 mother ship, during its first refueling stop on its way to the Kennedy Space Center. This, perhaps, was Kelly's most dramatic and visible participation in the space program. In the ensuing twelve years, the sight of the space shuttle, piggy-back on its mother ship, continued to draw crowds of curious onlookers.

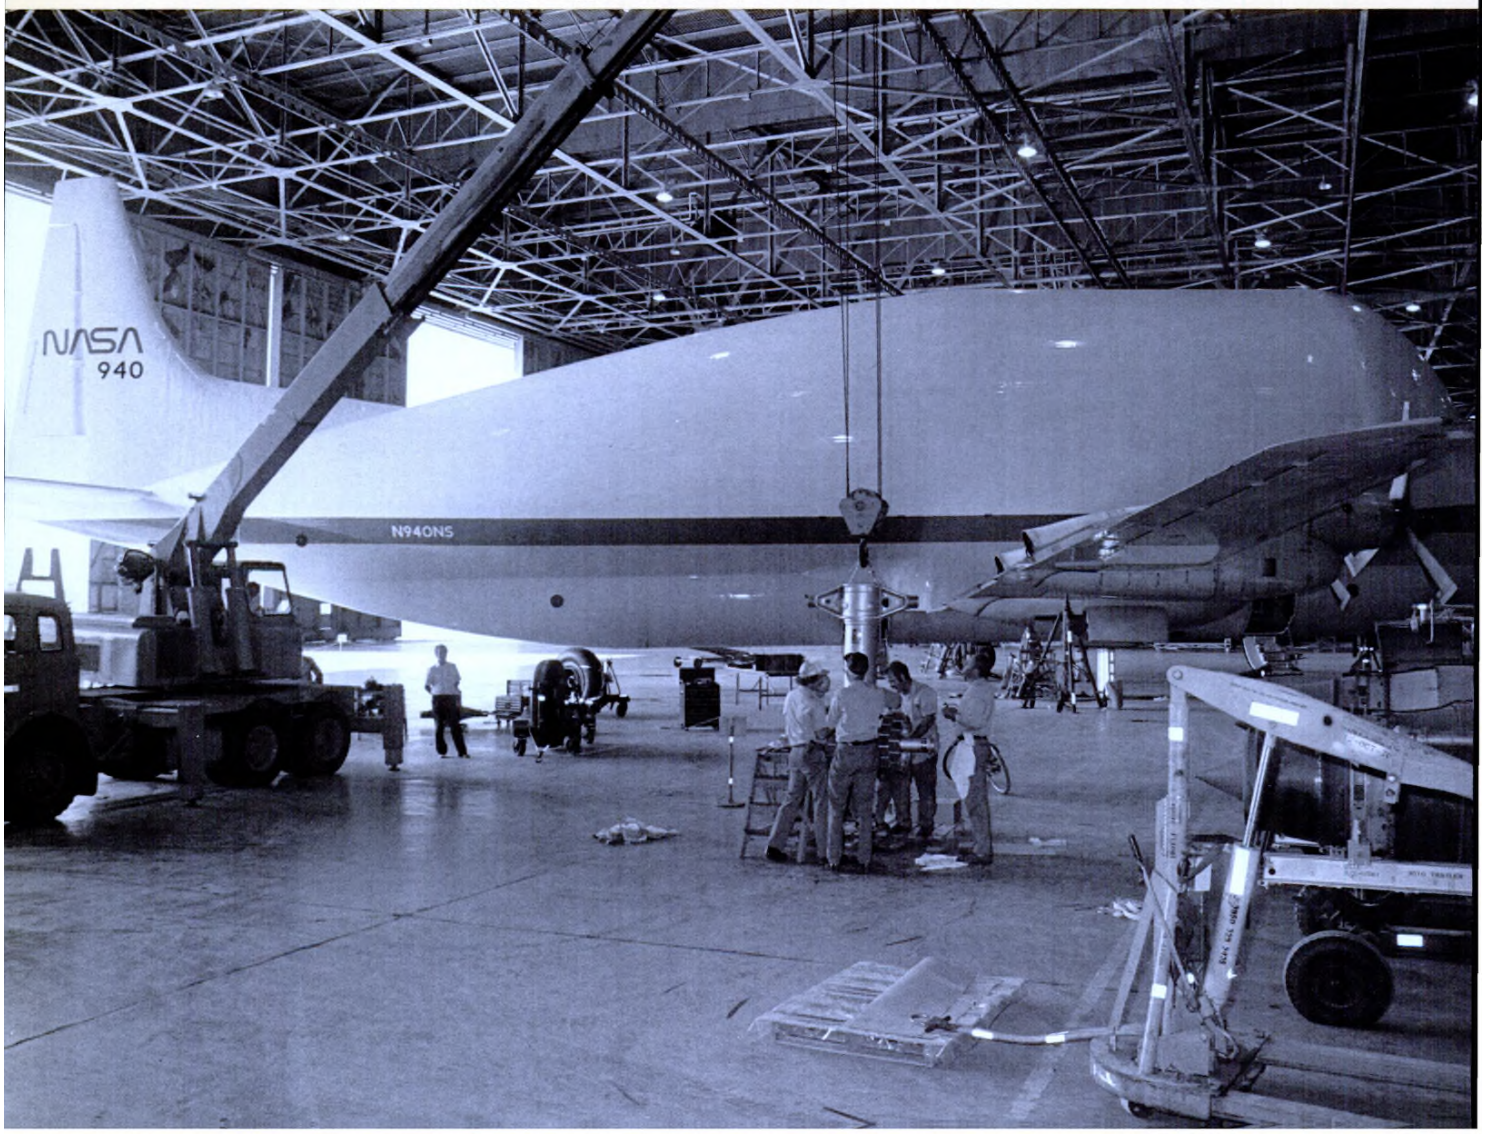

Apollo 11 burned over $350,000 worth of fuel on its trip to the moon and back. That may sound like a lot of money, but averages out to only 73 cents per mile.

Kelly played host to another unique craft in October 1979 when the National Aeronautics and Space Administration's "Super Guppy," made from parts of a Boeing 373 and a C-97, arrived so San Antonio Air Logistics Center mechanics could replace its landing gear. The whale-like airplane returned to Kelly occasionally for maintenance or when its home base, Ellington Air Force Base near Houston, Texas, expected bad weather.

In 1983, President Ronald Reagan announced the establishment of a comprehensive research program to eliminate the threat posed to the United States by nuclear ballistic missiles -- the Strategic Defense Initiative, or SDI.

By 1987, much of SDI research had reached the initial demonstration state, and Headquarters Air Force Logistics Command made lead air logistics center assignments for the six major SDI systems for which it was responsible. Assignment of the space-based servicing system came to the San Antonio Air Logistics Center. While still in the planning stages in 1991, the space-based servicing system was the "front runner" of SA-ALC's involvement in future space programs.

NASA's "Super Guppy" stopped at Kelly AFB in October 1979 for replacement of its landing gear.

The Age of Computers

Information is essential to logistics operations, but of all logistics operations, information flow was the slowest and most unwieldy. Realizing that computers could store and manipulate data, and turn out management products quickly and efficiently, AFLC began using them as early as 1954. By 1962, all materiel support managers depended on automatic data processing for at least part of their operations.

In 1965, AFLC employees recorded management information on 420 different mechanized data systems located in about 125 computers. Most were second generation and had no ability to interface or share common data; these computers relied on manual batch processing of transactions, which caused delays and inaccuracies. Command managers wanted a single, real-time, all encompassing system to manage their logistics operations. The Advanced Logistics System (ALS) was to be the solution. Using third generation computers, ALS would replace 104 data systems, modify six others, and interface fifty-six more. The plan called for data to be stored in one unified data bank at each ALC and the headquarters. Managers would use remote terminals to access the unified data bank at their base and those at other AFLC locations. Designed for extensive interfacing among separate information systems, ALS represented pioneering efforts in integrated system design.

Despite the high cost (estimated at $370 million) and the length of time before the system would become fully operational (seven years), Headquarters Air Force approved ALS in 1967. To make the investment more palatable, AFLC officials quoted savings in excess of $490 million (including those associated with manpower reductions) in addition to the return in increased readiness.

Command planners divided responsibility for development and design of ALS among the five ALCs and the headquarters. San Antonio was responsible for the Organic Depot Maintenance Workload Scheduling and Reporting process; the contract repair portion of the Depot Level Maintenance Resources Planning and Management process, which Headquarters AFLC took over in April 1974; the networks portion of the Depot Maintenance Production Planning process; and the Nuclear Ordnance Logistics Support (NOLS), a system unique to SA-ALC's Directorate of Special Weapons. Unfortunately, this divided responsibility fragmented the functional design of the system and contributed to inadequate coordination.

Numerous problems came up during development of ALS, but given its size and scope, this was not unexpected. State-of-the-art, but unproven, technology was incorporated into ALS, and when the contractor-designed software failed its initial test late in 1972, AFLC redesigned its plan, delaying the schedule. In February 1973, AFLC named San Antonio as the lead ALC to implement the first phases of the revised schedule. Several months later, SA-ALC's vice commander approved establishment of the ALS Control Group, which AFLC nicknamed PACER BYTE, to manage the implementation at San Antonio. By October 1973, the computers for the main ALS system (in building 1621) and NOLS (in building 1420) were up and running. By the following June, 472 remote terminals at various places on base were on line, and SA-ALC computer specialists had implemented all or part of five out of ten ALS phases.

Despite progress made at SA-ALC, ALS was in serious trouble. In August 1974, the AFLC commander had to inform the Air Force Chief of Staff that the command could not implement ALS within the time and budget limits set. It needed another year to redesign the program from ground up, but Air Force Logistics Command had run out of time. Congress refused to put any more time or money into ALS. Although it appropriated money to buy the main computers, Congress instructed the Air Force to terminate ALS in December 1975. Many of the problems stemmed from ALS's design and implementation concept.

By 1962, all materiel managers depended on computers for at least part of their operations.

Computer technology of the 1970s was not advanced enough to support the total program. Software development and hardware acquisition were done separately. Only late in the program did AFLC realize what the computers actually could do, and as designed, the software exceeded the capabilities of the hardware. Furthermore, AFLC's plan called for installing the hardware and software, interfacing the systems, and fully supporting the customer all at the same time--an unrealistic goal. Although AFLC expected ALS to provide significant manpower savings, withdrawing a total of 843 authorizations by the end of 1978 from SA-ALC alone, ALS made work: not only did the ALCs run parallel systems longer as implementation schedules slipped, but continual system redesign required even more manpower support.

By the time ALS officially "expired" in December 1975, NOLS was a going operation. Headquarters AFLC had transferred NOLS support and maintenance responsibility to San Antonio six months earlier. While less ambitious than the rest, NOLS was the only segment of ALS successfully developed and implemented as originally designed. Inventory managers, using fourteen remotes, accessed the NOLS central data bank for worldwide visibility of the nuclear weapons and assets they managed.

Although ALS did not live up to expectations, AFLC and the ALCs gained much hard earned knowledge. They learned that some sort of integrated logistics information system was necessary if AFLC wanted to continue using computers to manage Air Force resources, but they had to be upgraded for reliability. And the system had to be designed, procured, and implemented in an integrated fashion, completely installed, tested, and major problems solved one site at a time. These lessons proved invaluable for AFLC's next attempt to modernize its information systems.

It became imperative for AFLC to replace its aging computers by the late 1970s.

Logistics Management System Modernization Plan

Air Force Logistics Command officials faced several serious consequences at the end of ALS. A number of new aircraft, programmable material handling equipment, digital avionics and automatic test equipment, guided weapons, and modular engines and weapons had entered or were soon to enter the Air Force inventory. At the same time, manpower had declined dramatically, increasing the command's reliance on automated information systems. But no major improvements had been made to AFLC's logistics management system since 1967. To make matters worse, Congress, the Office of the Secretary of Defense, and the Office of the Secretary of the Air Force did not believe that AFLC could be trusted to manage a large ADP modernization program.

It took AFLC officials two years to overcome that lack of credibility, but by the end of 1978, the command had a new and approved program. Revised in the early 1980s to integrate and synchronize hardware and software acquisition, the Logistics Management System (LMS) Modernization Plan was an umbrella program to replace AFLC's old ADP equipment and data systems, carrying the command into the 1990s. It used commercial, off-the-shelf, proven technology. While AFLC officials and various contractors developed each information system independently, planners ensured software design matched hardware capabilities. Problems were inevitable and schedules delayed, but the LMS Modernization Program succeeded where ALS did not.

The first part of the plan called for replacing the command's antiquated IBM 7080 computers with new Control Data Corporation's CYBER and IBM 360-65 machines, which was done relatively quickly. Consequently, for most of the 1980s, emphasis was on the data systems and the communications network that linked them all together.

In 1987, SA-ALC had 208 individual data systems, running on twelve different computers, which ran the gamut from tape-driven technology to a limited number of on-line systems. By 1991, the situation had improved dramatically. The LMS portion of the modernization plan consisted of seven projects, consolidating many of the old information systems and providing real-time capability. One of the first systems to come on line was the Requirements Data Bank (RDB), which allowed managers to compute requirements and budget projections for their systems while assessing the impact of policy changes on the logistics pipeline. It reached initial operating capability in August 1985 and further improvements to RDB were on going.

To reduce the time-consuming effort of manually processing contracts, AFLC designed the Contracting Data Management System and divided it into two phases; the first was complete at SA-ALC in August 1987, cutting purchase request processing time by one-third. Work on the second phase continued into fiscal year 1992. The command designed the Stock Control and Distribution System to support the total distribution function, from processing and tracking requisitions to storage management as well as allocating and moving AFLC inventory. This system came on line at SA-ALC in April 1991.

The Depot Maintenance Management Information System (DMMIS) was designed to support the final core logistics function, depot level maintenance. Another extremely complex information system, the first portion of DMMIS, the Exchangeables Production Subsystem, came on line in July 1987. Implementation of the Manufacturing Resource Planning System, scheduled for 1993, would complete the DMMIS package.

Besides the hardware and software programs, the communications network which linked core and supporting systems and gave them worldwide accessibility consisted of intrasite and intersite networks and a gateway to connect the two. San Antonio ALC's Local Area Network, or LAN, provided terminal-to-computer and computer-to-terminal communications. It not only connected the various LMS programs, but also provided a means for communicating within the ALC and between ALCs and the headquarters. Installation of SA-ALC's LAN began in April 1986. By October 1989, twenty-two buildings were connected to it, while fifty-five more had access via modem links. The Intersite Gateway provided access to the rest of the Air Force via AUTODIN in March 1988 and the Defense Data Network in May 1989.

In addition to the systems which supported the four core logistics functions, the LMS Modernization Program included information systems which made the job easier. The Weapon System Management Information System provided strategic information to manage aircraft, spares, munitions, and support equipment. It became fully operational at SA-ALC in October 1987. The Engineering Data Computer

President Lyndon B. Johnson praised the C-5 at roll-out ceremonies at Lockheed's Marietta, Georgia, plant. The President termed the occasion a "long leap forward in the effective military might of America."

Assisted Retrieval System was designed to update and store digitized engineering drawings and reached final operating capability in February 1988.

The Automated Technical Order System provided automated updates to Air Force technical order text and drawings. Although it became operational in March 1987, the process of automating all of SA-ALC's information was an on-going process. Reaching full capability in September 1988, the Battle Staff Management System provided secret-level connectivity between Kelly's command post and those across AFLC. Comptrollers used the Central Procurement Accounting System to maintain up-to-the-minute visibility of expenditures in central procurement accounts. Designed to track the performance of parts and equipment, the first module of the Reliability and Maintainability Information System came on line in February 1990.

Despite the inevitable problems and schedule slips, the LMS Modernization Program was a success. The Air Force reaped a savings of $346 million with just six of the programs. A recent U. S. House of Representatives Appropriations Committee report even stated the program was one of the most successful computer acquisitions efforts ever fielded. The command had come far since ALS.

The C-5 "Galaxy"

On March 2, 1968, President Lyndon B. Johnson spoke to an assembled group of dignitaries at a ceremony marking the roll out of the first C-5 cargo transport from the Lockheed plant in Marrietta, Georgia. President Johnson stated:

> "The C-5A Galaxy can only be described in most extraordinary terms--it is the biggest aircraft in all the world. Its cargo floor alone is longer than the first flight that was made by the Wright Brothers. Its jet engine is twice as powerful as any that is now in existence. It can do three times the work of the biggest cargo plane that the United States now has. It cuts operation expenses almost in half. It can span the Pacific, from California to Japan, in one single jump. But most important of all: for the first time, our fighting men will be able to travel with their equipment to any spot on the globe where we might be forced to stand--and they will travel rapidly and efficiently.So it is much more than a roll out of a great aircraft that you are seeing here today. We are observing a long leap forward in the effective military might of America."

The C-5 was indeed a giant; the aircraft was more than 230 feet long, with a 220-foot wing span and a tail sixty-three feet high. Its crew sat in a cockpit fifty feet off the ground. Designed to accommodate various load configurations, the giant transport could carry 125 tons 3,200 miles or fifty tons one way across the Pacific Ocean. It could carry ninety-eight percent of an Army division's equipment, including M-60 main battle tanks, helicopters, and missiles.

Initially, the Air Force planned on outfitting three squadrons located at Charleston AFB, South Carolina; Travis AFB, California; and Dover AFB, Delaware; and a transition training unit at Altus AFB, Oklahoma, with a total of fifty-eight aircraft. Development and initial production costs, including the TF39 engine, totalled approximately $2 billion.

Early Management Planning

Even before the C-5's first flight at 7:47 on the morning of June 30, 1968, San Antonio Air Materiel Area personnel had been deeply involved in planning its logistical support. Headquarters AFLC named SAAMA as the C-5 System Support Manager on October 8, 1965, and the Specialized Repair Activity for its structural components on January 8, 1966. Over the next few years, virtually everything connected to the C-5, from its aerospace ground equipment to its malfunction analysis detection and recording subsystem, became a Kelly responsibility. San Antonio AMA officials viewed this assignment as a prize of great magnitude and importance. They were not alone. Several AMAs bid for the assignment, which all realized would entail a large work load in the future, but SAAMA won the spirited competition.

On March 10, 1966, SAAMA sent one of its managers to the Lockheed plant in Marietta, Georgia, to serve as the Resident Provisioning Team Chief. Two months later, San Antonio Air Materiel Area contracting experts began work on the Integrated Logistical Support Provisioning Plan.

mechanization of the logistics system to support C-5 provisioning was a new step in weapon systems procurement. On September 11, 1968, seventy people from the Directorate of Maintenance began system training at the Lockheed plant. Technical training of the military personnel who would maintain the C-5 began at Chanute AFB in Illinois, Keesler AFB in Mississippi, and Sheppard AFB in Texas.

The first Air Force "owned" C-5 arrived at Edwards AFB, California, on June 4, 1969, for sixteen months of flight and other types of testing. On December 17, 1969, Lockheed turned over the first operational C-5, which immediately flew to Altus AFB for crew transition training. This event also marked the beginning of SAAMA's job of logistical support for the operational C-5 fleet. On January 1, 1970, LOGAIR service began between Kelly and Altus to ensure timely parts support for the transition training unit.

The C-5A's Early Years

Major General William H. Reddell, SAAMA Commander, and a group of local dignitaries were on hand on January 30, 1970, to greet the first C-5 to land on Kelly. The aircraft flew in from Edwards AFB for an open house. Thousands of people from the local area came to Kelly to inspect the Air Force's newest airlifter. After this one-day stop, the C-5 returned to Edwards for further testing, but it gave San Antonio its first chance to see the giant transport that would become a familiar sight over the city during the next two decades.

Kelly's major work load during the first few years of the C-5's operational life centered around ensuring the activation of the new C-5 squadrons, in terms of logistical support, went as smoothly as possible. On December 8, 1969, Headquarters AFLC gave SAAMA responsibility for the Lead-the-Force-Program (later changed to Lead-the-Fleet), an accelerated flying hour program for selected aircraft, engines, and components to analyze the aircraft and identify any weaknesses in the structure and systems so corrections could be made before catastrophic failures occurred or fleet-wide problems surfaced. Kelly managers selected five aircraft from different production blocks to enter the accelerated flying hour program, which began on April 3, 1970. Four years later, in August 1974, aircraft number 68-0222 reached the desired two-year lead in operational flying hours over the rest of the fleet. During the next six months, the other C-5s in the program reached the two-year milestone.

Charleston AFB's 437th Military Airlift Wing was the first operational unit to receive C-5As. On June 6, 1970, the wing began flying strategic airlift missions under the operational test program. Less than a month after these tests began, the C-5 completed its first overseas cargo mission. It left Charleston during

Touchdown - the first C-5 landed at Kelly at 11:15 am, January 31, 1970.

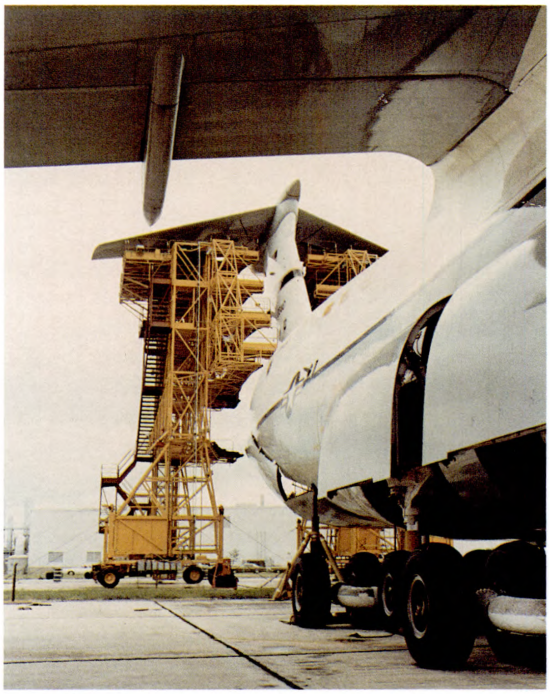

Facing Page: About 65,000 people from San Antonio came out to Kelly's Open House on January 31, 1970, to get a close look at the gigantic C-5.

the 4th of July weekend, flying 21,500 miles in ten days and touching down at six Pacific Air Forces bases before returning home. Nicknamed PROJECT FOXTROT, the mission demonstrated the aircraft's operational capability and provided training for ground crews in the Pacific.

Delivery of the first aircraft to Travis AFB occurred on October 23, 1970. Dover's squadron received its first C-5A on April 1, 1971. The last C-5A squadron, activated in February 1972, was also at Travis.

On May 18, 1973, Lockheed delivered its final C-5A to the Air Force. Originally, the Air Force intended to buy 120 of the giant transporters, but immense cost overruns forced this number to drop to eighty-one. With acquisition of the last A-model, SAAMA C-5 managers logistically were responsible for a fleet of seventy-nine aircraft (two had been lost previously to accidents).

The C-5 was so large, maintenance of the giant "bird" required ingenuity and a lot of special equipment.

Maintenance

During the early 1970s, concurrent aircraft production, testing, operations, and updates made life challenging for those involved in the C-5 program. These first years of parallel testing and operations revealed many reliability problems. As problems were uncovered, Lockheed engineers made improvements and developed numerous component configuration changes, which they not only incorporated in new production models, but also added to aircraft already turned over to the Air Force. Beginning in fiscal year 1971, C-5 engineers divided the various engineering change proposals (ECPs) and time compliance technical orders (TCTOs) that incorporated the system design changes into "increments," a set of specific changes on specific aircraft. Not all fixes applied to all aircraft. Consequently, the number of manhours spent actually doing the work at either the Lockheed plant or Kelly shops depended on the ECPs or TCTOs to be performed. Some of the most time consuming work in the early 1970s involved modifications to strengthen the airframe and installation of new pylons (dubbed the "Maxi-Mod") to prevent the engine from separating from the aircraft.

The first C-5A to come to Kelly for maintenance, in this case TCTO system update work, arrived from Charleston AFB on April 19, 1971. It touched down at 1:10 p.m. to the strains of "Those Magnificent Young Men in Their Flying Machines," played by the Air Force Band of the West. Over a thousand people, including local media representatives, attended the brief ceremony. Immediately after the event, workers moved the C-5 to pad number 32 on the hard stand area for maintenance. San Antonio AMA staff members knew this was just the start of a maintenance work load that gradually would grow to enormous proportions.

Over a year later, on August 1, 1972, aircraft number 68-0222 arrived at Kelly for programmed depot maintenance (PDM), the first C-5 to do so. All previous C-5 work done at Kelly was the result of the previously mentioned updates and system design changes. Most of these "fly-ins" (aircraft with essentially unscheduled maintenance) were in the shops for one-time-only or emergency work. Programmed depot maintenance, successor to the Mod/IRAN program begun in the 1950s, marked the emergence of the C-5 as a more stable system in which depot level maintenance could be scheduled and planned in advance.

San Antonio C-5 program managers initially scheduled eighteen C-5s for the first year of programmed depot maintenance; however, a significant learning curve, leaks discovered during fueling operations, and unexpected problems with the landing gear, delayed completion of the PDM work. In addition, an increased requirement for B-52Ds drew workers from the C-5A PDM line. To speed up the PDM effort, on July 25, 1973, Headquarters AFLC approved establishment of a fourth aircraft position in building 375 for C-5 PDM. Immediately, Kelly engineers began working on a device to tow a C-5 in and out of the huge hangar. Maintenance workers used it for the first time on December 11, 1973.

C-5 Paint Job

An aircraft as huge as the C-5 provided countless challenges to those maintaining it. One of these was painting the giant bird. While SAAMA personnel had painted numerous types of aircraft over the years, including a complete camouflage paint scheme for the B-52 during the Vietnam War years, they had never done a stripping and repainting job of the magnitude required for the C-5. In preparation, SAAMA awarded a $2.2 million contract to turn building 365 into a suitable facility. Completion of the construction project on June 15, 1972, provided a one-of-a-kind facility that was big enough for the C-5 as well as explosion-proof, air-filtered, and temperature-and-humidity-controlled. And it was finished just in time.

Colonel B.W. Bodager, San Antonio Air Materiel Area's Director of Maintenance, welcomed the crew of the first C-5 that arrived at Kelly for maintenance.

Painting the C-5 required modification to the paint and corrosion control facility.

During 1971, an engineering team inspecting six C-5 aircraft found the exterior paint beginning to crack on the upper wing surfaces, exposing the inner and outer wing boxes to corrosion. Common, too, was a loss of paint on the bottom of the rear fuselage. The solution, directed in February 1972, was the corrosion-preventive paint project, which involved stripping the acrylic lacquer paint, cleaning and treating the metal, and completely repainting the exterior with polyurethane paint. With the unique capabilities of the painting facility in building 365, workers were able to repaint a C-5 in only eleven days. Nevertheless, the sheer size and height of this oversized aircraft tested the ingenuity of Kelly workers.

During this initial painting of the C-5A fleet, Kelly workers used the traditional Military Airlift Command (MAC) white and gray color scheme. In 1980 the Air Force looked at the possibility of repainting the C-5 with the camouflage scheme used on most of the aircraft in advanced forward areas, including Europe where the C-5A fleet played an important role. On January 29, 1981, Headquarters Air Force approved MAC's request to camouflage the fleet with a paint scheme known as European I, a three-color pattern of shades of two green and one of gray. After much debate, SA-ALC's C-5 managers decided that Kelly's maintenance workers would repaint the C-5s during a "mini-programmed depot maintenance" (a limited range of depot-level maintenance items). Work began on the prototype on May 9, 1983, and finished on June 20, twenty-three days ahead of schedule.

C-5 Wing Modification Program

When Lockheed won the contract in December 1965 to build the C-5A, the Air Force required certain performance specifications, such as take-off and landing distances and weight requirements, for the new cargo plane. But during its development, Lockheed engineers realized the plane would not be able to meet the specified weight requirements. To decrease the total weight of the aircraft, Lockheed decided to reduce the weight of the wings, using thinner wing boxes. They opined that with use of new fastener techniques and increased quality control efforts, the thinner wings would be strong enough to meet the desired service life of 30,000 flying hours. During static testing of the wings in July 1969, one failed when carrying 124 percent of the load limit. Engineers corrected this deficiency with a structural modification.

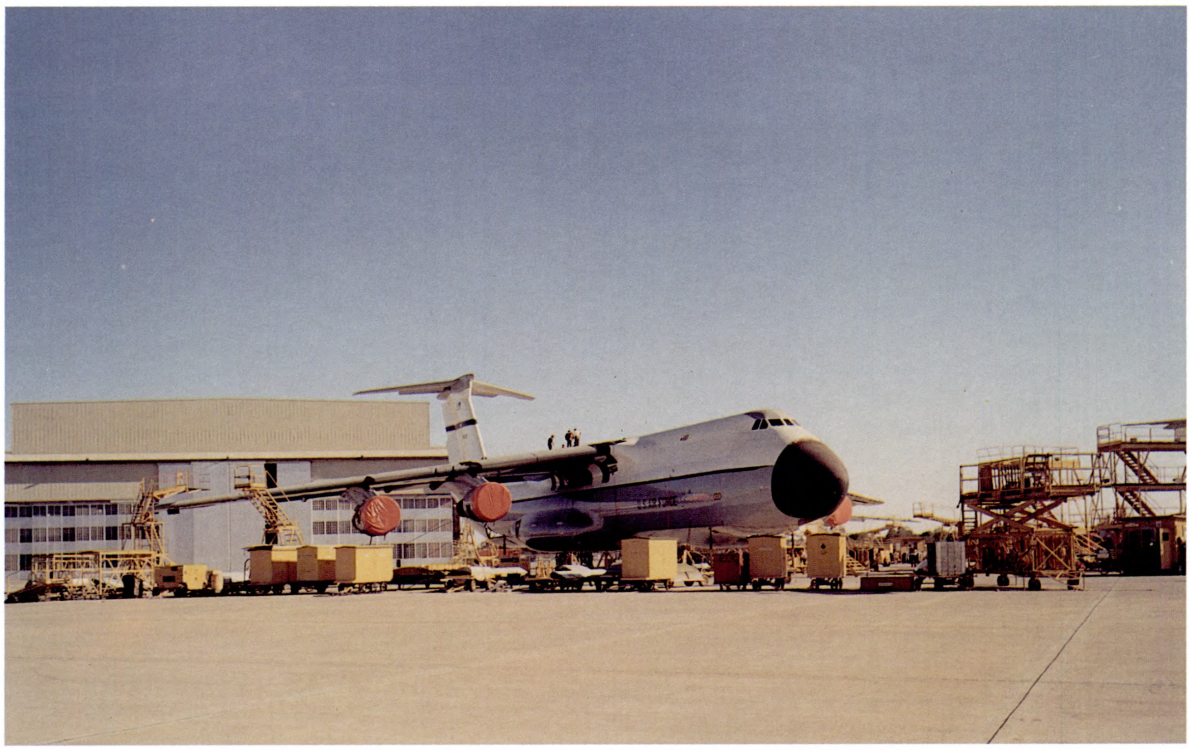

In January 1970, just one month after delivery of the first production aircraft, fatigue cracks were discovered in the wings of the flight test aircraft. Fatigue testing of the redesigned wings also began at this time. The Secretary of the Air Force asked the Air Force Scientific Advisory Board to study the wing failures. After several months, the board concluded the C-5A wing would not reach the goal of 30,000 flying hours. Lockheed continued special "beef up" retrofits to strengthen the wing boxes, but these modifications increased the wings' service life only to 8,000 hours, clearly below the Air Force's specifications.

In September 1971, the Air Force limited the load the C-5A could carry to 174 thousand pounds or eighty percent of that specified in the contract. In March 1973, the Secretary of the Air Force selected an active lift distribution system as an interim measure to reduce stress on the C-5 wings. He also approved a major wing modification program to achieve the desired 30,000-hour service life.

A year later, April 1974, Lockheed submitted a proposal to replace the inner and center wing boxes and strengthen the outer wing box on the lower surface. But the price tag was high. Estimates for the research alone reached $22 million, while the overall project was priced at more than a billion dollars. On December 23, 1975, the Air Force awarded a $28.4 million contract to Lockheed-Georgia to study methods to modify and strengthen the C-5's wings. The Air Force modified the contract in 1976 to include replacing the outer wing box.

In 1983, Kelly workers began camouflaging the C-5 fleet with the European I paint scheme.

As early as 1970, the Air Force recognized the need to modify the C-5s wings.

The contract was divided into four phases. An initial $4 million went toward the first phase of engineering analysis and testing. During the second phase, Lockheed was to fabricate kits and associated hardware for two wing sections. (A kit consisted of parts designed for assembly on one aircraft of a multi-aircraft requirement.) The plan called for Lockheed to install one of these kits and then subject the aircraft to extensive fatigue testing, while the other kit would be installed on a C-5 for flight testing. The final two phases involved kit fabrication for all C-5As and kit installation at the Lockheed plant. Although the size of the C-5A fleet was small, at this time seventy-six aircraft, the wing mod program would last for five years, 1982 through 1987.

Responsibility for the design and test phases of the modification project belonged to Aeronautical Systems Division of the Air Force Systems Command. San Antonio Air Logistics Center managed the final two phases, fabrication and installation. On December 20, 1978, SA-ALC Commander, Major General Lynwood E. Clark, approved establishment of a C-5A Modification Program Management Office within the Directorate of Materiel Management to oversee all work under the production contract. With the high dollar value of the contract and the length of time involved, SA-ALC managers deemed it prudent to have some center personnel on-site to work the many issues that would arise. In September 1981, SA-ALC established an operating location at Lockheed's Marrietta plant to work with the Air Force Plant Representative Office to ensure compliance with contract specifications and to coordinate and evaluate proposed changes. Originally staffed with five people, this expanded to eighteen as production of modified aircraft increased.

Lockheed engineers reached a significant milestone on May 9, 1980, when the wing they were fatigue-testing reached the 30,000-hour level of operation, four months ahead of schedule, with no significant problems. They decided to continue the fatigue testing for another 30,000 hours to see if and when problems would occur. Just before the wing reached the 60,000-hour point, cracks appeared in a fitting outside the wing box where the wing and fuselage met. Lockheed's designed fix easily met the Air Force's specifications. In addition, the Air Force Scientific Advisory Board met between July 1 and 2, 1980, to review the results of the first fatigue test. It

recommended continuing the wing modification program.

Another milestone for the wing mod program occurred during the summer. On May 14, 1980, Lockheed thought the other modified aircraft was ready for its flight test, but a final X-ray inspection of the wing tip revealed moisture and corrosion. It took three months to correct the problem and develop an ultrasonic inspection technique for the wing tips, flaps, ailerons, and slats. A combined Air Force and Lockheed crew finally tested the C-5 during a four hour and twenty-five minute flight on August 14. The success of this first flight led to fifteen more through October for a total of fifty-four hours and twenty-one minutes of incident-free flying time.

Fabrication of the wing boxes already had begun. On January 7, 1980, workers at Avco Incorporated, Memphis, Tennessee, a subcontractor to Lockheed, began manufacturing the wing boxes. Final go ahead for installation was authorized in November 1981 when the Air Force exercised its 1982 option for modification of five aircraft. A MAC crew flew the first C-5A to be modified to the Lockheed-Georgia plant in January 1982. Lockheed completed this aircraft and returned it in May 1983.

Once begun, production of the modified C-5As progressed smoothly. Lockheed delivered all the aircraft on time or ahead of schedule. On July 7, 1987, Lockheed workers finished the last C-5A, bringing to a close the largest modification program ever managed by SA-ALC, or any other ALC .

The C-5A Wing Mod Program came in approximately $200 million under budget, an achievement of which all concerned could be proud. At the ceremony marking the end of the program, Colonel Ronald Roberts, SA-ALC's Director of Materiel Management, stated that the program was "...an extremely successful, superbly managed effort...." Major General Lewis G. Curtis, SA-ALC Commander, added, "With the completion of the wing modification, the Galaxy, the Air Force's largest airlifter, will proudly fulfill its role into the 21st century."

The silhouettes of two aircraft mechanics working high on the wing of a giant C-5 Galaxy look small as one of the cargo carriers is overhauled for the Air Force at SA-ALC.

SARPMA and the Drive Toward Consolidation

In an effort to save money, the General Accounting Office and later the Department of Defense, pushed for consolidation of similar military organizations located in the same geographic area. San Antonio, with four air force bases and one Army post, was a prime candidate for this type of merger. With this in mind, the Air Staff decided to consolidate base-level contracting for San Antonio's four air force bases, and on January 1, 1977, the San Antonio Procurement Center (later changed to the San Antonio Contracting Center or SACC) located on Kelly Air Force Base came into being. A year and a half later, centralization struck again. On October 1, 1978, the San Antonio Real Property Maintenance Agency (SARPMA) became responsible for real property maintenance for military facilities in the San Antonio area, primarily Fort Sam Houston and Brooks, Kelly, Lackland, and Randolph AFBs. Personnel for the agency, located at the San Antonio Air Force Station on Fort Sam Houston, came from the five installations. Kelly contributed 721 military and civilian authorizations from its civil engineering division and associated support organizations.

From the beginning, SARPMA faced an uphill battle for support. None of the area commanders viewed a consolidated maintenance organization with any favor. They feared a loss of mission responsiveness and direct control over a major resource. Any new organization suffers from growing pains, and SARPMA wasn't any different. But SARPMA's growing pains, resulting customer dissatisfaction, and a move away from centralization in the 1980s, contributed to its demise eleven years later.

The Air Force tried to move away from SARPMA as early as 1983. San Antonio Air Logistics Center leaders and their counterparts at Headquarters Air Force Logistics Command were steadfast in their desire to extricate themselves from both SACC and SARPMA, firmly believing the consolidated agencies never adequately supported the contracting and civil engineering requirements at Kelly's huge industrial complex. An AFLC study comparing facility projects among the five air logistics centers showed that Kelly received forty-five percent less real property maintenance per square foot with SARPMA than the other bases with their own civil engineering organizations.

Eight years of experience with the consolidated agency, extra costs, continuing perceptions of unresponsiveness, and the extensive management efforts required to make SARPMA work, convinced the major air commanders that the two consolidated San Antonio agencies should go. Pulling Kelly's base contracting business from SACC proved relatively easy. By April 1986, the phased transfer of the center's contracting work load began. However, getting Army approval to disestablish SARPMA and SACC took another year.

Finally, in April 1988, the public announcement concerning the disestablishment of the two agencies by October 1, 1989, was made. On July 1, 1988, Kelly activated the 2851st Civil Engineering Squadron. Plans called for the new unit to gradually absorb SARPMA's work loads, equipment, and as many of its people as possible.

Monday, October 1, 1989, marked both a beginning and an end. It was the first workday for Kelly's fully reestablished civil engineering squadron and the day eleven-year-old SARPMA officially ceased to exist. But the lure of manpower and budgetary savings promised by centralization and consolidation is very seductive. Who is to say that the "son of SARPMA" isn't just around the corner?

The C-5B Program

World events in 1979 and 1980, the failed hostage rescue attempt in Iran and the Soviet invasion of Afghanistan and intervention in Poland, convinced the Department of Defense that its existing airlift fleet was too small to meet the current and projected demands American international policy placed on it. To improve intertheater airlift capability and enhance the United States' ability to transport and sustain American military forces on a global basis, the Air Force awarded a contract in 1981 to Lockheed-Georgia for acquisition of fifty C-5B aircraft. San Antonio ALC, manager of the C-5A, received system program management responsibility for the B model as well.

Lockheed designed the C-5B to have performance capabilities equal to or better than its predecessor. Particularly noteworthy was a lessened take-off distance coupled with increased payload capability.

Incorporating all the technological improvements made over the last thirteen or so years, the B model contained over 100 improved systems, including the redesigned wing, an improved navigation system, and new radar and engines. (The TF39-1C engines provided an additional 3,500 pounds of thrust over the original TF39-1B models.)

The C-5A benefitted from this as well, as many of these improvements were applied to the older version in modification programs. Furthermore, when

ordering spare parts for the C-5A, SA-ALC item managers chose the C-5B upgraded parts as the preferred items, improving the reliability and maintainability of the A model.

The Air Force accepted its first C-5B in December 1985. For the next three-and-a-half years, C-5Bs rolled off the Lockheed production line right on schedule. Finally, in April 1989, MAC Commander-in-Chief General Duane Cassidy, flew C-5B 87-0045, the last B model delivered from the Lockheed-Georgia plant to Dover AFB. The original contract had an estimated price tag of $8 billion, with provisions for increases due to inflation. However, lower than expected inflation and price reductions on certain renegotiated items dropped the final cost to $6.7 billion. Management responsibility for the C-5B program transferred to SA-ALC on March 31, 1989, giving the ALC total responsibility for the entire C-5 fleet.

As the C-5Bs moved into service with the active duty military airlift wings across the country, MAC transferred forty-four A models to Air Force Reserve and Air National Guard units: the 433rd Military Airlift Wing (Air Force Reserves) at Kelly AFB and the 105th Military Airlift Group (New York Air National Guard) at Stewart International Airport, Newburgh, New York, received C-5As in 1986 while the 439th Military Airlift Wing (Air Force Reserve) at Westover AFB, Massachusetts, received C-5As the next year.

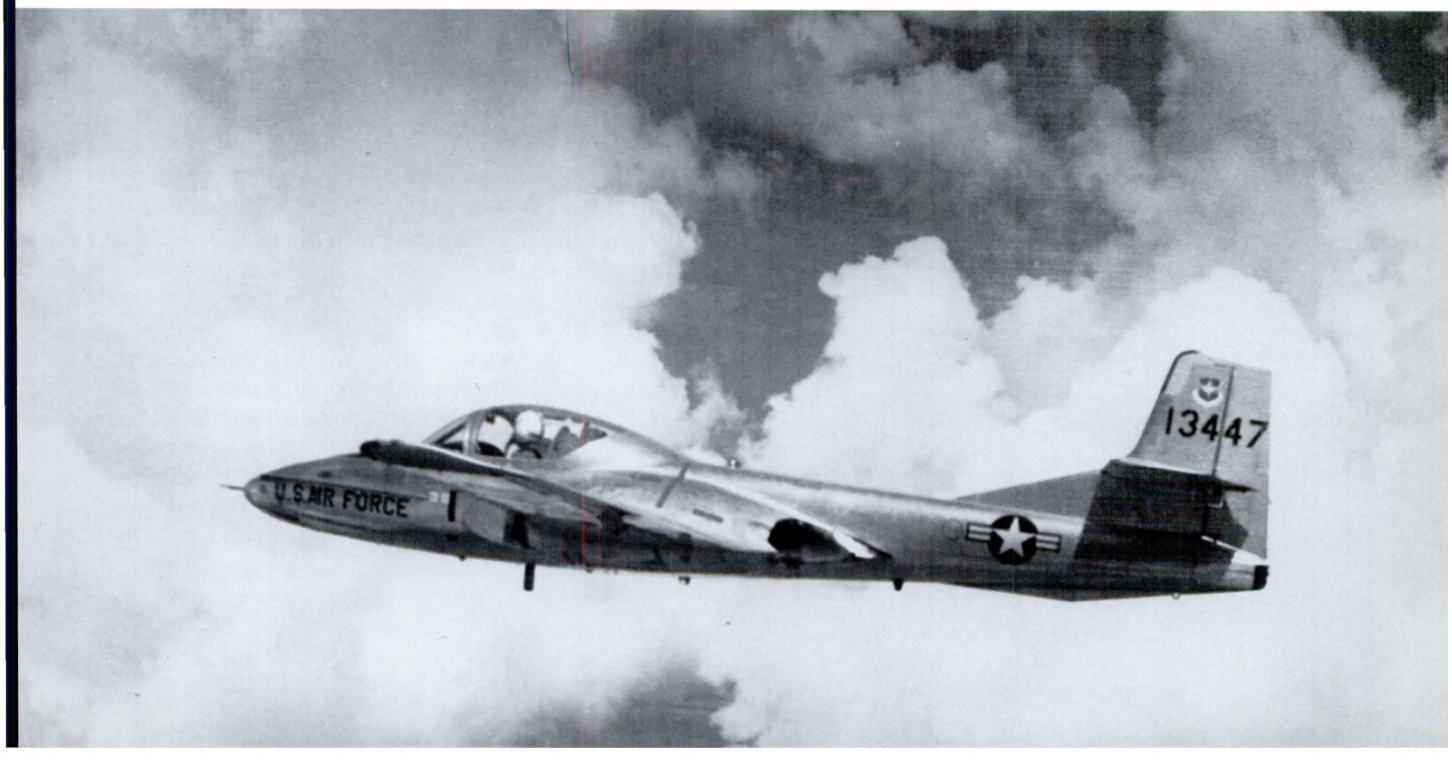

A Spectrum of Aircraft Management

In the mid-1960s, SAAMA gained management responsibility for a diverse group of aircraft--trainers like the T-37 "Tweety Bird," T-38 "Talon," and the T-43 "Flying Classroom;" cargo planes such as the C-5 and C-9 "Nightingale;" and combat aircraft like the F-5 "Freedom Fighter," A-37 "Dragonfly," and the OV-10 "Bronco."

The Trainers

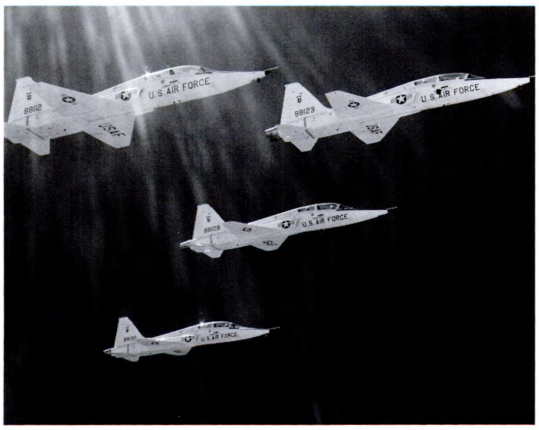

On August 2, 1965, in conjunction with the Air Materiel Area Phase-Out Program, the T-37, T-38, and F-5 system and item management work loads transferred to SAAMA from Middletown AMA, Olmsted AFB, Pennsylvania. San Antonio's Directorate of Materiel Management established a new Aircraft and Equipment System Support Management Division to handle the new responsibilities, including those for 412A Life Support Equipment. The first T-37 and T-38 aircraft arrived from Olmsted AFB on August 17, 1965, for engineering prototyping and guidance for future modifications. While these aircraft were new to the San Antonio AMA, they were not new to the Air Force. Cessna began deliveries of the T-37 in 1955, and by April 1961 it was the standard trainer for the Air Force. Also in 1961, Northrop delivered its first super-sonic T-38 to Air Training Command. On January 31, 1972, program

T-37 "Tweety-Bird" - primary jet trainer since 1961.

SA-ALC picked up management responsibility for the T-43 navigator trainer in 1971.

PACER CLASSIC was designed to extend the T-38 Talon's useful life into the 21st century.

In addition to responsibility for the C-51, SAAMA also managed the C-9 "Nightingale" Aeromedical Transport.

management responsibility for the "Talon" transferred from Aeronautical Systems Division, Air Force Systems Command, to SAAMA. San Antonio picked up management of another trainer on August 18, 1971, when Headquarters AFLC assigned the T-43 navigator trainer to SAAMA; however, deliveries of Boeing's spacious trainer did not begin until 1973.

Air Force student pilots had been learning to fly T-37 jet trainers for almost thirty years when the Air Force began looking for a replacement for its aging fleet. By 1982, the Air Force had chosen the Fairchild T-46 to replace its T-37s, but schedule delays, manufacturing difficulties, management problems, and congressionally mandated budget cuts plagued development of the new trainer from the start. Finally, in March 1986, Air Force leaders announced their decision to cancel the T-46 program. Instead, they chose to upgrade the existing T-37s. The resulting Structural Life Extension Program, begun in November 1988, would extend the life of the T-37 until the year 2006.

The T-38 also had a program designed to extend its useful service life into the next century. PACER CLASSIC, which began in 1985, consisted of various modifications to ensure the structural integrity of the T-38 and improve its reliability. These modifications affected most of the major systems of the trainer, including airframe, engines, and avionics; but like most programs, completion of the modifications depended heavily on funding. Nevertheless, SA-ALC managers expected both PACER CLASSIC and the Structural Life Extension Program to be completed by the mid-1990s.

Cargo Transports

In addition to responsibility for the giant C-5, SAAMA also managed the C-9 "Nightingale" Aeromedical Transport, which Douglas developed from its DC-9 civil airliner. The first production model rolled out of the factory in June 1968 and deliveries to the 375th Aeromedical Wing at Scott AFB in Illinois began two months later on August 10. The Air Force immediately put the new air evacuation aircraft to use, transporting casualties from the fighting in Vietnam to the West Coast for medical treatment. Program management responsibility transfer for the C-9A from Aeronautical Systems Division to SAAMA took place on February 1, 1970.

Governments not requiring sophisticated air defense systems found the A-37 to their liking. Relatively inexpensive to buy, support and operate, the A-37 proved an ideal close air support aircraft.

Combat Aircraft

American participation in the war in Vietnam and a change in military doctrine emphasizing counter-insurgency operations spawned development of new combat aircraft during the 1960s. One of these was the A-37, an attack version of the T-37 trainer. In 1962, two T-37s were equipped with machine guns, rockets, and practice bombs to determine their suitability for counter-insurgency operations in Vietnam. Success of those tests lead to production of the A-37A, which began arriving at Air Force units in 1966. The new attack aircraft reported for combat in Vietnam on May 2, 1967, and within a year, A-37s had flown 10,000 missions. Deliveries of the A-37B, an advanced version built mainly for the Military Assistance Program, began in 1968. San Antonio, as system support manager for the T-37, also had responsibility for the attack version.

North American-Rockwell International designed the OV-10 specifically for counter-insurgency operations in jungle terrain. Its ruggedness, simplicity of operations, and maneuverability made it a natural for forward air control, observation and reconnaissance, close-air support, and limited ground attack missions. In December 1966, AFLC designated SAAMA as the Bronco's system support manager. Deliveries to Tactical Air Command and Pacific Air Forces units began in 1968. On October 22, 1972, management responsibility for the OV-10 transitioned to SAAMA from Aeronautical Systems Division.

In its more than two decades of service, the OV-10 flew combat missions in Vietnam and performed forward air control missions with the 601st Tactical Control Wing in Germany. Other units flying the OV-10 were stationed in Korea, Alaska, Hawaii, California, and other states. During this time, SA-ALC managed a variety of modification programs, nicknamed PACER BRONCO, to update its avionics and wiring systems. As the Air Force entered the 1990s, its leaders decided to retire the versatile OV-10, beginning in December 1991. Still an excellent aircraft, the Air Force "Broncos" would be offered for foreign military sales.

The F-5 "Freedom Fighter"

The F-5 first flew in 1959 in parallel development with the T-38. Northrop originally developed it as a

modern, versatile tactical aircraft for sale on the international market. By April 1964, Air Training Command was using the F-5A to train foreign students. With its outstanding flying qualities throughout the entire flight range, the "Freedom Fighter" did very well on the international market. In February 1965, the United States first sold the F-5 to Iran, South Korea, and Greece. This was followed by F-5 Military Assistance Program deliveries to Spain, Norway, Taiwan, South Vietnam, Israel, Thailand, Canada, the Netherlands, and Ethiopia.

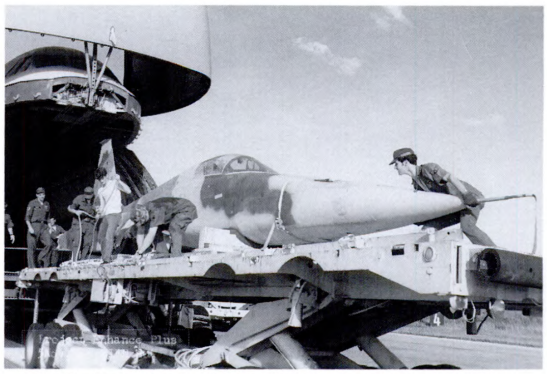

Chosen as a replacement in the international market for fighter aircraft, the F-5E "Tiger II," equipped with laser-guided "smart" bombs, first flew in August 1972. American pilots flew the "Tiger II" to train foreign students in its operation and as "aggressors" at combat training schools.

On October 2, 1974, SA-ALC received full engineering responsibility for all versions of the F-5 "Freedom Fighter" from Systems Command, giving it complete engineering responsibility for the many foreign countries that flew the aircraft. Recognizing Kelly's increased work load in the area of foreign military sales and the Military Assistance Program, on July 1, 1974, SA-ALC officials consolidated all International Logistics Program functions into one International Logistics Program Branch within the Directorate of Materiel Management. On January 1, 1976, the branch formed the nucleus of a new SA-ALC organization, the Directorate of International Logistics. This organization was short lived, however, for in November 1983, it again became a division within the Directorate of Materiel Management.

The F-5 Technical Coordination Group

The F-5 made history in 1978 when the United States revealed its plans for a $4.8 billion jet fighter package for the Middle East, including the first American sales to Egypt, which bought fifty F-5Es for $400 million.

By 1979, the United States' Military Assistance Program had sold or made available over 1,600 F-5s, approximately ninety percent of the entire fleet, to twenty-two different countries. While SA-ALC F-5 managers could support the Air Force's aircraft, they were unable to handle the increased work load of the worldwide fleet. Recognizing these support problems but wanting to provide service to its F-5

The United States shipped F-5s to South Vietnam in the early 1970s.

customers, Headquarters Air Force established the F-5 Technical Coordination Group on October 1, 1979. San Antonio ALC set up a corresponding group to manage the program.

With the group, the Air Force hoped to provide a single point of contact for follow-on technical support for countries with the F-5, and to increase the reliability and maintainability of the fighter through the exchange of non-sensitive technical information. Countries flying the F-5 were encouraged to participate on a cost sharing basis, and by the end of its first year, approximately half of the eligible countries had joined.

Phase out of the F-5

By the mid-1980s, the United States Air Force had only a small fleet of F-5s used in pilot training and as "aggressors" by the tactical air forces. In December 1986, an F-5F crashed due to a failure of the upper cockpit longeron. This accident lead to a January 1987 fleet-wide inspection, which revealed fatigue cracks in three other F-5s. San Antonio engineers developed repair procedures, and the aircraft were fixed. But in December 1987, workers at RAF (Royal Air Force) Kemble in England found fatigue cracks on an F-5E during a phase inspection. Consequently, SA-ALC ordered another survey and reduced the normal interval between these checks from 150 flight-hours to seventy-five hours. These inspections left nine F-5s grounded worldwide for cracks in the upper longeron.

Materiel Management engineers, working with Northrop, developed repair procedures and purchased forty repair kits. However, they were not sure how long the modification would last since the high stress and strains the F-5s experienced in flight caused the aircraft to deteriorate faster than expected. To further complicate matters, maintenance workers at Clark Air Base in the Republic of the Philippines discovered severe corrosion on the lower longeron on both sides of the cockpit during repair work on the upper longeron. Faced with these serious problems, SA-ALC officials recommended the Air Force consider phasing out the F-5s before 1993 , and maybe as early as 1991.

In April 1988, the Air Force decided to phase out the F-5s by the end of fiscal year 1989. As the major commands stopped flying their F-5s, the Air Force offered the aircraft to various countries in "as is" condition; that is the receiving countries became responsible for inspection and repair of the lower longerons as well as other subsequent maintenance.

Air Training Command quit flying its F-5s during the last quarter of fiscal year 1989, the last command to do so, thus ending the aircraft's twenty-five years of illustrious service in the United States Air Force.

Shifting Priorities--Round Two

The downturn in military funding during the 1970s reflected a natural shift in priorities after a war, but it also mirrored the anti-military feeling of the American public. Defense spending (after inflation) decreased by more than twenty percent, leaving huge shortfalls in readiness, sustainability, and force structure. Extremely tight defense budgets lead to a "hollow force" with few spare parts and little ammunition. To fund badly needed force modernization programs, the Air Force opted to buy new aircraft (the F-15 "Eagle" and A-10 "Thunderbolt II" became operational in 1976 followed by the F-16 "Fighting Falcon" in 1978) at the expense of logistical support. But as new weapon systems entered the inventory, the requirement for spares grew. High interest rates, longer acquisition lead times, and shortages of strategic materials eroded buying power even more.

While the United States focused its attention on the war in Vietnam and then consistently underfunded defense, the Soviet Union developed and deployed a steady stream of new, more powerful, and increasingly accurate strategic weapons. This relentless growth of Soviet capabilities eliminated the lead

By 1991, over twenty-seven friendly countries flew the F-5 "Freedom Fighter."

the United States once held. Furthermore, the Soviet Union continued its increasingly aggressive policies, combining efforts with Cuba in Angola and Ethiopia (the Soviets provided arms and financial backing while the Cubans supplied troops) and furnishing arms to clients in South Yemen, Nicaragua, and Vietnam.

After the war in Southeast Asia, the United States sought to rebuild a consensus on the country's proper role in international affairs. While they were no longer willing to serve as the world's "policemen," the American people were not ready to withdraw into isolation. This lead to a reexamination of national security policy late in the 1970s as the public became aware of the threat posed by the Soviet Union's massive military might and more aggressive behavior. The Iranian hostage crisis and the Soviet invasion of Afghanistan and intervention to crush the Solidarity movement in Poland made most Americans receptive to presidential candidate Ronald Reagan's push for patriotism and renewed support for the military. Reagan campaigned on the charge that his predecessors had allowed the Soviet Union to gain a "margin of superiority" and made a firm promise to stop the serious deterioration in American military capabilities. President Reagan entered office on a groundswell of support for his confrontational tone and commitment to reassert American leadership in foreign affairs.

Seeing a significant gap between what American forces might be called upon to do in war and what they actually were capable of doing, President Reagan initiated a long term modernization program, spending $1.1 trillion on defense between fiscal years 1982 and 1985. His administration's strategic modernization program upgraded all three legs of the American strategic triad with procurement of MX "Peacekeeper" intercontinental ballistic missiles (ICBMs), Trident II sea launched ballistic missiles, and B-1B and B-2 bombers. And, as importantly, the program provided improved command, control, communications, and intelligence capabilities for American strategic and tactical forces.

Despite the attention given to strategic forces, conventional forces received even greater funding.

President Ronald Reagan visited Kelly on June 24, 1981.

The global characteristic of American interests and commitments made it imperative for the United States to be able to deploy effective combat forces worldwide. New weapon systems began appearing in increasing numbers. More F-15s and F-16s replaced the F-106s and F-4s which had seen service in Vietnam. Acquisition of additional E-4A "Sentry" aircraft enhanced early warning and command and control capabilities while new EF-111 "Ravens" filled the tactical electronic warfare role. The Air Force retrofitted venerable B-52G and H models with new offensive avionics systems and equipped them with air launched cruise missiles. Airlift came into its own in the 1980s as Air Force leaders saw it had a specific deterrent function in regional conflicts. More C-5Bs, C-141s, KC-10s, KC-135s, and ultimately brand new C-17s would provide the means of quickly projecting American military power anywhere in the world. Improvements seen in this generation of aircraft were primarily technological changes in propulsion, avionics, and radar systems, not airframes. That occurred later in the 1980s with the introduction of stealth technology found in the F-117, B-2, and F-22, the advanced tactical fighter.

Between 1980 and 1983, the top priority was to improve readiness and sustainability of existing forces, which meant air crews flew more often and the stocks of munitions and spares increased. After a decade of neglect, logistics received the funding needed to provide both the initial surge and staying power for combat forces. At the end of fiscal year 1983, Air Force mission capable rates rose twenty percent over those in 1979, and sufficient spares were available to generate three times the number of tactical sorties than in 1980.

The Impact on SA-ALC

This sudden infusion of money and influx of new aircraft, engines, and other Air Force equipment had a dramatic impact at Kelly. San Antonio ALC's funding more than doubled from fiscal year 1979, when its managers handled $7.2 billion, to the $16.49 billion budget of fiscal year 1982. The high water mark came in fiscal year 1984 when SA-ALC's funding topped $17.76 billion. San Antonio's work load increased, too, as mechanics installed new offensive avionics equipment on B-52s; put increasing numbers of B-52s, C-130s, and both models of the C-5 through depot level maintenance; repaired more TF39, T56, F100 engines and modules; and worked on a wide variety of commodity items, including support equipment for the new B-1B bomber. Distribution personnel stocked increased levels of spare parts, equipment, and expendable items used during depot-level repair. Contracting specialists had their hands full ordering much needed material now that funding was plentiful, and materiel managers were busy orchestrating it all.

Reality Sets In

But this doubling of funding could not go on indefinitely. As early as 1984, congressional concerns about the sky-rocketing federal deficit, mounting claims of Reagan Administration overspending on high technology (including the President's hotly debated Strategic Defense Initiative introduced in 1983), and procurement horror stories about $600 coffee pots and $700 spanner wrenches caused enthusiasm for defense to weaken. Reagan's defense recovery program lasted much shorter than most people think; begun with the 1981 budget, it peaked in 1985. In December 1985, Congress passed legislation designed to bring the fast-growing federal debt under control by the early 1990s. The Balanced Budget and Emergency Deficit Control Act of 1985, better know as the Gramm-Rudman-Hollings Act, recognized that increased military spending contributed to the deficit problem. By design, the legislation ensured that if the annual federal budget exceeded the established deficit ceiling by ten billion dollars, federal funds would be sequestered, automatically canceling designated federal appropriations with no regard for their priorities. A disproportionate fifty percent of the total overrun would come out of the defense budget.

By 1988, in the name of helping relieve the federal deficit, the armed forces were deactivating combat units, canceling programs, and reducing strength with cuts that had no relation to actual requirements. As in the 1970s, most of the reductions came from the military's operations and maintenance accounts, which translated to less money for civilian payrolls, flying hours, munitions, spare parts, training, and installation maintenance. But AFLC leaders of the 1980s were determined to do what they could to prevent a repeat of the previous decade's "hollow force." They hoped organizational changes, restructuring, shifts in management philosophy, and a renewed emphasis on quality would enable them to meet the upcoming challenges.

Kelly's Military Units

Kelly has seen hundreds of military units organized over the past seventy-five years. During World War I, newly formed aero squadrons filled the pages of the monthly post returns. This changed to air depot groups during World War II; and since 1945, countless squadrons and groups have come and gone as Kelly's responsibilities changed, increased, or decreased over the years.

Formation of one of Kelly's military organizations was a direct result of the lessons learned during the conflict in Southeast Asia. In the spring of 1965, Air Force Logistics Command sent its first rapid area maintenance team to repair crashed and battle-damaged aircraft in Southeast Asia. Initially civilians manned these teams, but in October 1965, Headquarters Air Force directed AFLC to increase the military presence in the rapid area maintenance teams for operations in combat areas or under combat conditions. A new unit, the combat logistics support squadron, resulted. These teams of military maintenance, supply, and transportation specialists would be ready to respond immediately anywhere in the world.

On December 1, 1967, Headquarters AFLC activated new units at each of its five air materiel areas; San Antonio Air Materiel Area's was the 2954th Combat Logistics Support Squadron. By 1971, the Kelly-based squadron had served at Tan Son Nhut and Bien Hoa Air Bases in South Vietnam and U-Tapao Air Base in Thailand, performing time compliance technical order work on B-52s and providing supply support. During Operation Desert Shield/Desert Storm in 1990 and 1991, men and women of the 2954th deployed again -- this time to Southwest Asia where they repaired battle-damaged B-52s, set up bare-base air freight terminals, and overhauled jet engines.

Since the early 1950's, San Antonio Air Materiel Area's Directorate of Special Weapons managed and repaired the Air Force's nuclear ordnance commodity items; but prior to 1962, the 3079th Aviation Depot Wing at Wright-Patterson AFB in Ohio controlled the weapons located at the two aviation depot squadrons (AVDS), the 3096th AVDS at Travis AFB in California and the 3097th AVDS at Westover AFB in Massachusetts. Personnel at these two sites maintained and stored the weapons. On April 18, 1962, as part of an effort to reduce personnel at the headquarters level, AFLC announced the inactivation of the 3097th; Kelly's Directorate of Special Weapons would pick up its responsibilities on July 1. On that date, SAAMA activated the 39th Logistics Support Group, assigning to it the two logistics support squadrons which provided airlift support (the 7th at Robins AFB, Georgia, and the 19th at Kelly) and the two aviation depot squadrons. The 39th was short-lived, however; on July 1, 1963, SAAMA deactivated the group; the 7th and 19th Logistics Support Squadrons were reassigned to the Military Airlift Transportation Service, and the aviation depot squadrons were assigned directly under the Special Weapons Directorate.

The aviation depot squadrons' work load increased during the 1970s. On February 15, 1970, the 3096th AVDS completed its move from Travis AFB. California, to Nellis AFB, Nevada. Located outside Las Vegas, Nellis had more space for expanded facilities and construction of a new air freight terminal needed by the 3096th. On July 1, 1971, AFLC activated a new AVDS, the 3098th, at Kirtland AFB, New Mexico. This was part of an overall reorganization of nuclear responsibilities which came about as a result of the redesignation of the Defense Atomic Support Agency to the Defense Nuclear Agency. Two years later, on September 1, 1973, the 3097th AVDS completed its move from Westover to Barksdale AFB, Louisiana, with the phase down of Westover. The 3097th remained at Barksdale until October 1, 1988, when the unit was inactivated and its responsibilities assumed by the other two aviation depot squadrons.

In 1975, Ogden Air Logistics Center, Hill AFB, Utah, had two units, Detachments 66 and 67, located at the Lackland Training Annex (also known as Medina Base) to store, maintain, and load standard air munitions packages and standard tank, rack, adapter, and pylon packages (STAMP/STRAPP). On November 15, 1975, responsibility for these two detachments merged together to form Detachment 40. After six months of extensive preparation and training, the new unit was declared operationally ready to deploy its munitions and associated paraphernalia. During Operation Desert Shield/Desert Storm, Detachment 40 shipped over seventeen million pounds of munitions to Southwest Asia.

When General Alfred Hansen assumed command of AFLC in the summer of 1987, he pushed for consistency in organizational structure -- consistency both within the command and with the rest of the Air Force. This push, coupled with the desire to enhance AFLC's military structure, prompted the activation of several new squadrons at each ALC during 1988.

General Hansen first turned to AFLC's flight operations, reorganizing the flight test branches into test squadrons. On January 15, 1988, Headquarters AFLC designated and activated the 2873d Test Squadron on May 1. The new organization continued to provide billeting, food service, and housing supply support to the base. On July 1, the 2851st Civil Engineering Squadron was activated in preparation to absorb gradually the work loads, equipment, and personnel from the San Antonio Real Property Maintenance Agency, which was deactivated October 1, 1989. The final squadron to be activated at Kelly was the 2893d Distribution Squadron, which, on November 15, 1988, brought all supply, transportation, and munitions military personnel into one military organization.

Kelly Air Force Base's 2851st Security Police Squadron won the Air Force Outstanding Security Police Award (Medium Unit) for the year 1987.

DESERT STORM
OUR TROOPS

CHAPTER EIGHT

TOWARD A NEW BEGINNING

For forty-five years after the end of World War II, American military and foreign policy was built around the concept of containment, strategies which aimed at blocking Soviet expansion around the globe. Foremost among the various strategies developed to carry out containment was that of nuclear deterrence, built upon the American strategic triad of bombers, ground-based intercontinental ballistic missiles, and Navy ballistic missile submarines. At the same time, the military prepared itself to fight conventional actions as well, developing the weapons and strategies needed to conduct operations in defense of American interests around the world.

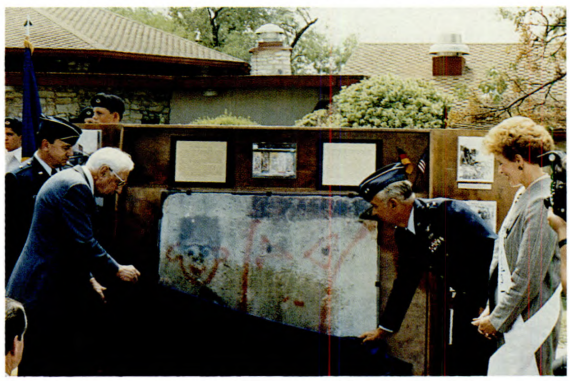

The Air Force was a vital element in American planning. Two-thirds of the nuclear triad fell under Air Force operational control, and the Air Force provided, along with the Navy, the surest means to project American power rapidly throughout the world. Developing both nuclear and conventional capability was a difficult job for the entire military, but it was a particularly acute problem for the Air Force, which had to balance the needs of both strategic and conventional combat forces as well as maintain the airlift capability required to move ground units wherever they had to be as rapidly as possible. The need to carry out such diverse missions on such a vast geographic scale not only created problems in terms of strategy, but also demanded a variety of different weapon systems and support structures which could keep those systems operating around the world.

In 1981, the Air Force recognized the need to develop a comprehensive framework for logistics planning and published the first "Logistics Long-Range Planning Guide." Updated annually, this guide provided broad planning goals rather than specific proposals, but it emphasized the crucial role logistics played in military planning and the need for planners to develop a logistics system capable of supporting widely varying levels of conflict under a variety of circumstances. In general, though, the premise that the main enemy would be the Soviet Union remained. Through the first half of the 1980s, increased defense budgets allowed Air Force logisticians to rebuild stocks of parts and add new systems to the inventory.

Then, beginning in 1989, a stunning series of political changes began to rock the world, forcing American leaders to cope with a dramatically different set of strategic questions. Soviet control over Eastern Europe unraveled with stunning rapidity. Germany, divided since 1945, moved toward reunification with shocking swiftness, while within the Soviet Union independence movements in the individual republics, coupled with crushing economic problems everywhere in the country, suggested that the Soviet state might soon cease to exist in its familiar form. At the same time, American economic dilemmas, particularly the burden of a growing budget deficit, forced U. S. military and political leaders to implement spending cutbacks and look for ways to increase efficiency at a lower cost. Even the events which led to Operation Desert Shield and Operation Desert Storm, while indicating that the need to project American military strength still existed, could not halt the move toward a smaller, less expensive defense structure. The Cold War was apparently over.

Kelly gets a piece of the Berlin Wall.

Kelly Defends Freedom

For almost seventy-five years the men and women of Kelly Air Force Base have answered their country's call in defense of the basic liberties we all hold dear. When in 1948, the Soviet Union closed off all rail and road traffic into Berlin, the Western Allies rose to the challenge by beginning an around-the-clock airlift of supplies into the encircled city. For fifteen months, cargo airlift flew in a steady stream, and Kelly's workshops, working twenty-four hour shifts, repaired the R2000 engines of the C-54--workhorse of "Operation Vittles"--while supply and support personnel provided some 15,000 items of critical equipment.

Some twelve years after the successful end of the Berlin Airlift, the city once again became the focus of the world's attention. During the night of 12 August 1961, the Soviet-backed East German government erected a wall to divide Berlin, precipitating a Cold War crisis that threatened to erupt into war. Once again, Kelly's people responded, providing vital logistical support during the largest deployment of American aircraft to Europe since the end of World War II.

For over twenty-eight years, the Berlin Wall loomed as a symbol of a divided Europe and divided world. For a generation, the United States, at immense cost, stood steadfast alongside our allies. In 1989, with striking suddeness, the unthinkable happened. The wall came tumbling down.

For the people of Kelly's organizations--the San Antonio Air Logistics Center and Electronic Security Command--the collapse of the Berlin Wall signified a triumph of unparalleled dimension and the culmination of nearly thirty years of dedicated service in the defense of freedom and democracy for all people around the world.

A C-54 flies over a crowd of awaiting Berliners. By the end of "Operation Vittles" American and Allied flyers had delivered over 2,300,000 tons of food, medicine, coal and other supplies.

PACER STRIDE

Shrinking budgets and the apparent elimination of the threat which had dictated the posture of American defense for nearly two generations meant that all the services would have to grapple with a new set of dilemmas and discover new ways of doing things. Certainly, those Air Force commands most directly concerned with acquisition and logistics support would have to develop some way of doing the same job with fewer resources. Shortly after taking command of AFLC in August 1987, General Alfred G. Hansen toured the various ALCs, and came away disturbed by the lack of uniformity among the ways the different centers organized their management operations. Determined to tighten control and have uniformity in the way system program managers (SPMs) did things, General Hansen ordered each ALC to form themselves around three basic SPM models. At the same time, he supported efforts to integrate the complete spectrum of support activities under the SPM for each system. Known as Integrated Weapon System Management, this plan gave the SPM control over everything from contracting, through materiel management and maintenance, to budgeting, warehousing, and transportation.

Each center was initially allowed to go ahead on its own in setting up this arrangement, but in May 1988, General Hansen decided the program needed centralized direction and halted all organizational changes until they could all be consolidated under the single code name PACER STRIDE--with STRIDE actually an acronym for System Program Management: Technology Infusion, Reorganization Initiatives, Integrated Planning, Development and Acquisition, and Engineering Management. Over the summer, a working group at AFLC headquarters redefined the objectives of the program, and in August General Hansen decided that engineers would be assigned to the SPM and contracting personnel would physically be collocated with the SPM's team.

Final touches were put on the program in early October and officials at Kelly met soon afterward to plan local implementation. San Antonio planners proposed to carry out PACER STRIDE in two phases. Unlike the other ALCs, San Antonio had to deal with severe limitations in terms of facilities. Most local managers were in building 171, a converted warehouse which was already overcrowded. Squeezing in additional specialists and shifting offices around without totally disrupting daily support

Under PACER STRIDE, squeezing in additional specialists and shifting offices in building 171 in order to collocate personnel (buyers with program managers, item managers and contracting personnel), proved to be a complicated task.

in the process required a complicated series of steps. Local officials wanted to collocate personnel from the Directorates of Materiel Management and Contracting and Manufacturing during the first phase, simultaneously restructuring the Directorate of Materiel Management. Phase II would collocate buyers with program managers, item managers, and contracting personnel.

The Kelly officials who planned PACER STRIDE initially expected to complete Phase I by April 1989 and Phase II, which would get started as soon as Phase I was complete, by April 1990. But in January 1989, Air Force Logistics Command headquarters announced that no funding was available to support PACER STRIDE implementation. This news forced officials to scale back much of their planning, especially the proposed changes scheduled for Phase II, but during February and March members of the affected directorates spent harried and hectic days trying to get the Phase I changes complete by the beginning of April. It took a few extra days to finish, but on April 12 the move was finished.

Despite the lack of adequate funding for San Antonio's Phase II PACER STRIDE moves, the Center went forward with planning, hoping to find a way to accomplish the most important aspects of Phase II as cheaply as possible. The use of forklifts from the Directorate of Distribution, for example, avoided the need to use a private moving firm and was one way costs were kept down.

Shortly after the first groups of personnel completed moving to their new quarters in early June 1989, major problems popped up. Installation of computer network and telephone cables promptly overloaded the ancient wiring in building 171--a 1940s era warehouse, converted to office space. Then, as installers laid new cables in the building, asbestos tiles were found. The need to remove them delayed things further. Then, just as workers put the finishing touches on the Phase II effort, events at the Pentagon shook things up once more.

Defense Management Review

In February 1989, shortly after taking office, President George Bush asked the Department of Defense to develop a plan to implement recommended changes in the acquisition process, and improve overall defense management. The result was a "Defense Management Report to the President," issued by Secretary of Defense Richard Cheney in July 1989 that substantially altered the procurement process and laid out the foundation for a series of sweeping changes throughout the entire American military. The report was soon better known by the acronym DMR, for defense management report. (Later, DMR was more often used to stand for defense management review, after the process it started.)

While it was clear from the start that many organizational changes would take time to implement, it was also clear that the earliest focus of managerial change would be in the areas of procurement, distribution, and maintenance operations, all of which would have an impact on the way the San Antonio Air Logistics Center carried out its missions.

To some extent, the Air Force anticipated the coming DMR with a "No Value Added" review ordered by Air Force Chief of Staff General Larry Welch in June 1989. All Air Force Logistics Command organizations were asked to study their activities and eliminate those which did not directly contribute to accomplishing their mission. Two months later, with the DMR process underway, General Hansen ordered AFLC organizations to review all their activities and organizations in an effort to streamline command-and-control and improve efficiency.

During the fall of 1989, the Office of the Secretary of Defense Comptroller began issuing proposals called DMR Decisions (DMRD), each of which suggested specific changes in various military organizations. By early November there were over twenty of these decisions, each linked to substantial cost savings, and many of which applied directly to AFLC organizations and operations. They had an immediate impact on reorganization plans at San Antonio.

At the end of September, San Antonio Air Logistics Center Commander, Major General Richard D. Smith, halted remaining PACER STRIDE activity until clearer direction arrived from Air Force Logistics Command headquarters. One issue which quickly dominated the thoughts of officials at San Antonio was a proposal to combine Air Force Logistics Command with Air Force Systems Command under Defense Management Review Decision Number 943.

An Open Letter to the Work Force from

General Charles C. McDonald, HQ AFLC Commander

With the announcements of additional Defense Management Review details last week, we can proceed with a roadmap for the Air Force Logistics Command of the future.

The DMR has resulted in a thorough review of our organizational structure--in greater detail than other reviews of previous years. The DMR's goal is to improve the way Department of Defense does business, specifically with more efficiency, more accountability, fewer people and at less cost. Change is necessary to accomplish the DMR goals.

Before discussing DMR, a brief word about another item I know is of great concern to you. Earlier in the current fiscal year we faced severe budget problems, particularly relating to the civilian payroll. A hiring freeze and release of some temporary employees in the command were necessary.

This was done in order to help deal with the budget shortages. I believe we will be able to manage the payroll without significant personnel turbulence for the remainder of the fiscal year.

Regarding DMR, the decision to merge Air Force Logistics Command and the Systems Command has been deferred by Secretary of the Air Force Donald Rice. He has put his confidence in our ability to streamline the day-to-day business and realign command operations over the next five years to help Department of Defense meet its goal of saving $39 billion.

Within AFLC, we intend to cut redundant levels of management, consolidate similar functions, and improve work flow. Specific details of Headquarters AFLC, ALC and other AFLC unit restructuring are still under study, and will be implemented incrementally in a measured, sensible fashion.

There will be a gradual work force drawdown in the command over the next five years by about 7,400 persons, military and civilian, as a direct result of the DMR. About 680 will come out of AFLC Headquarters and other Wright-Patterson-based AFLC units, and from 1,150 to 1,500 at each air logistics center. You've read the specific numbers, by location, in your base newspaper. I'm confident that these reductions can be handled through normal attrition, civilian hiring and promotion freezes and perhaps an early retirement program, where needed. This drawdown will result in a different way of doing business.

We need to become a smarter, more efficient, more quality-oriented operation. As we proceed, QP-4 will become even more crucial to our success. It means accepting more responsibility and accountability at the worker level for quality at the front end of each process. It also means we need additional enlightened leadership from the ALC shop floors to the hallways in headquarters which allows workers to do their very best. Our best decisions are made when we have input from all levels.

I realize that change means uncertainty which can be very discomforting. But I view the process as good for the command and its people. I'm optimistic about the future. My concern has been and will continue to be our people. Without people we can do nothing.

Let me repeat; it is my goal to avoid reduction-in-force actions that separate our people from the Air Force. I appreciate the concerns of all our AFLC employees. Let's work together to develop the innovative, efficient, and cost effective ways we will need to meet new and continuing challenges of our AFLC mission--providing combat strength to the operational commands.

The Merger Issue Debated

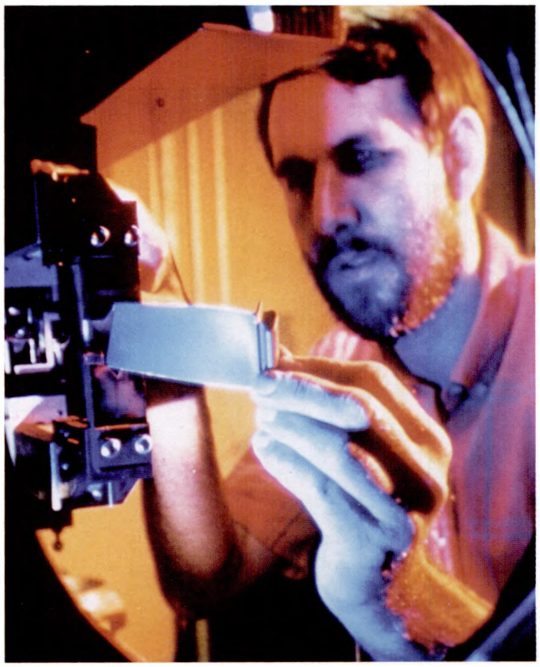

The possibility of recombining the two Air Force commands most concerned with acquisition and management surfaced early in the Defense Management Review process. It was not an entirely new issue; the two commands had been part of a single organization until the 1950s, and suggestions that they be recombined had sometimes appeared during the following decades.

Under the press of DMR, a new study team looked at the question anew in mid-1989, concluding that a merger did offer some benefits, particularly in terms of providing unified management of weapon systems from the beginning of the acquisition process to the time they left the inventory. On the other hand, the group also concluded that the missions of the two commands were decidedly different. The commander of AFLC, General Alfred Hansen, openly opposed combining the two commands, arguing that they had completely divergent missions; Air Force Systems Command (AFSC) was concerned with research, development and acquisition while AFLC dealt with supply and maintenance. In his view, one or the other of these two areas, each of which was vitally important, would suffer if the two commands were merged into a single entity. Moreover, combining them was not necessary to fulfill the purpose of the DMR. Under General Hansen's direction, AFLC already was emphasizing quality and efficiency. What he proposed in September 1989, in lieu of a merger, was a major restructuring of AFLC, seeking economies and streamlining the command's organization.

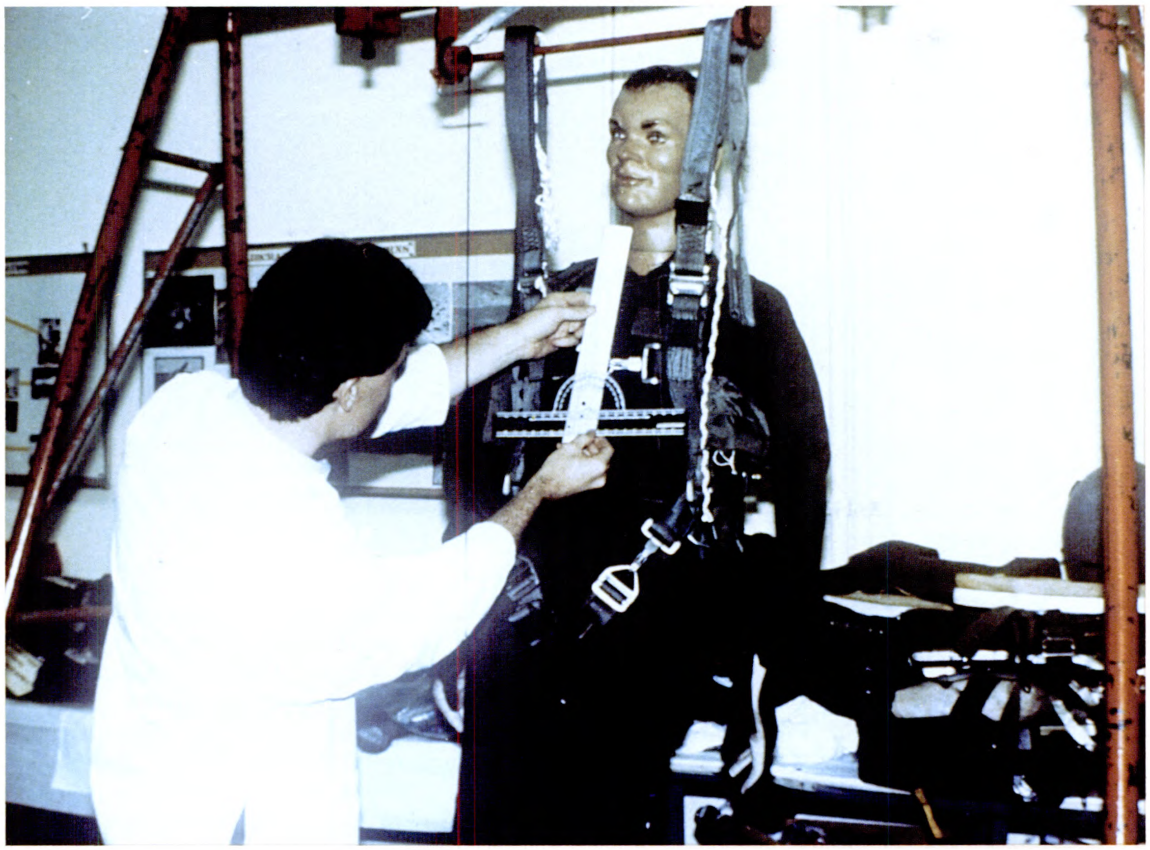

The Product Directorate Concept

The organizational structure around which General Hansen wished to remodel the air logistics centers was referred to initially as the "company concept," a term which was replaced within a few months by the term "product directorate concept." Basically, it pushed the underlying premises of PACER STRIDE to their ultimate conclusion, while simultaneously making a sharp break away from the traditional organizational parameters. Organizationally, air logistics centers were built around functions such as maintenance, management, or distribution. No single organization controlled a weapon system completely. An engine manager, for example, depended upon contracting experts to buy necessary parts, maintenance specialists for repair, and distribution workers to store and ship engines in and out of the center. Everyone was working toward the same end--keeping the number of engines in the field as high as possible--but each group worked for a different organizational entity. Problems which emerged had to be solved by temporarily bringing members of these different organizations together in what was called a "Tiger Team." By the end of the 1980s, a number of such teams might exist at any time, and officials who studied this situation readily recognized that this indicated that the organizational divisions were causing operational inefficiencies.

The "company concept" promoted by General Hansen rearranged things around products rather than functions. Changing the term to "product directorate concept" did not change this fundamental premise, it simply avoided the semantic link to private enterprise. Whatever the name, under the concept, the manager of a system controlled almost everything which affected his program--maintenance, supply, contracting, finance, and management. Under PACER STRIDE, workers in some of these different areas shared office space, but under the product directorate concept they would be part of the same organization.

Keeping pace with changing technology was a constant challenge for Kelly's work force.

The Life Support Equipment Investigation Laboratory

Tucked into a small building very close to the railroad tracks that once delineated the southern boundary of Kelly Number 1 was one of Kelly's least known organizations. The Life Support Equipment Investigation Laboratory was not only small, it was unique. No other organization like it existed anywhere in the world.

The foundation of the laboratory was laid in the mid-1970s with the consolidation of all management for life support equipment at San Antonio. Lacking anyone at Kelly with the expertise to investigate possible failures of the F-4 ejection system, the then life support equipment manager persuaded British engineer Michael Grost to come to San Antonio. An engineer with Martin-Bates Aircraft, Limited, Mr. Grost had been working under contract with Pacific Air Forces since the end of the 1960s.

At Kelly, still working under contract, Mr. Grost initially concentrated on F-4 systems, but was soon handling investigations of other systems as well. In March 1983, a small lab was set up in a single room of building 183. Over the following eight years, the lab slowly expanded as its role, if not its staff, grew.

By the end of the 1980s, the lab had supported over 150 accident investigations. Using knowledge from such diverse fields as engineering, physiology, chemistry, and physics, the lab is able, through patient analysis and deductive logic, to reach a clear understanding of what led to the accident, and even the body position and physical actions taken by the pilot. The lab trains all Air Force life support officers, life support superintendents, and egress supervisors and instructs Air Force physiological training officers, flight surgeons, and aviation pyschologists. Special training courses are run for foreign students and accident investigators from allied countries.

In recent years, both the Canadian and Israeli air forces restructured their accident investigation facilities after examining the lab. And, in recent years, the lab has analyzed crash sites in Southeast Asia, helping determine the status of airmen listed as Missing-in-Action during the Vietnam War. Small, almost unknown even within the Kelly community, the lab earned an unrivaled record as one of the crucial elements of the Air Force accident investigation system.

Heightening Tension Within the Work Force

By this time, several years of increasingly tight budgets, coupled with the proliferation of reorganization programs and management reviews which began in 1988 and 1989, spawned any number of rumors among the SA-ALC work force. Even though the center added employees at the end of 1989, news releases about impending personnel reductions and a widely announced early retirement program, simply added grist to the rumor mill. On top of this came the announcement in May 1990 that San Antonio would restructure into the product directorate concept by October. In some work areas, employees were near panic.

Center officials were well aware of this situation, and in August of 1990, General Smith held a series of briefings on the ALC restructuring for supervisors from throughout the ALC. Speaking directly, General Smith candidly admitted that tight budgets and force level reductions already proposed by the Air Force would force Kelly to shrink, too. But, he took pains to reassure his audience that, so far as he knew, this would not involve the involuntary termination of full-time employees. Although no one could predict the future with perfect certainty, it seemed most likely that normal attrition would absorb the vast majority of personnel cuts. On the other hand, as General Smith was equally candid in pointing out, the story might be different in a year or two.

Reorganization and Restructuring

General Smith's remarks probably did not stop further rumors from circulating around the center, but in the meantime planning for the implementation of the product directorate concept moved into high gear. At Kelly, planning for this restructuring was carried out under the code name PROJECT STAR--an acronym standing for Streamlining/Transitioning of ALC Resources, and General Smith took the step of outlining the main features of the plan in a letter to all managers and supervisors.

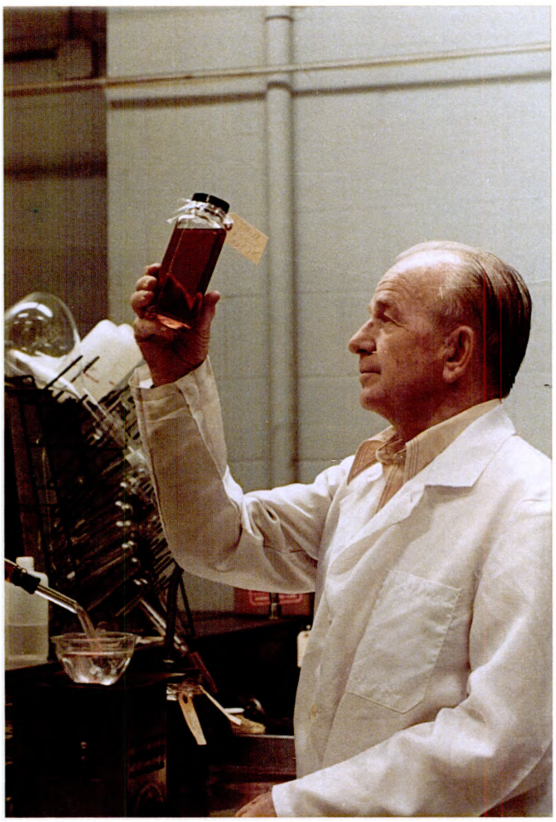

After thoroughly investigating the way successful businesses did things, General Smith pointed out, AFLC identified the common elements shared by those businesses and deliberately set out to incorporate and apply similar procedures. Among these were the need to combine functions and avoid duplication of effort; eliminate tasks which did not further the mission of the center; improve communication, both within the center and between San Antonio and its customers; integrate similar functions into a single organizational entity; and increase worker involvement in the activities of the ALC to increase pride and morale. The QP4 quality program, now metamorphased into a Department of Defense quality effort called TQM (for Total Quality Management) was an important aspect of this, since it offered a series of analytical methods to evaluate the way things were being done and identify those parts of the process needing change. In short, at the same time that the Defense Department was orchestrating change via the DMR, AFLC proposed nothing less than a complete overhaul of its operations in the biggest series of wholesale organizational changes since the 1940s.

PROJECT STAR was the code name for local product directorate reorganization activities.

The confusion and stress of PACER STRIDE was soon dwarfed by the hectic effort underway throughout the SA-ALC by the late summer of 1990 as the the former Directorates of Maintenance, Materiel Management, and Plans and Programs spun into a series of completely new organizations. Many small staff offices escaped wholesale change, as did the center's two unique directorates--Aerospace Fuels and Special Weapons. The specialized tasks handled by these two organizations easily dovetailed with the activities in other organizations, but, after some discussion, they continued as independent entities. However, the other large directorates essentially vanished in their familiar forms, and in most cases this involved the movement of large numbers of people.

On the Road Again...

Aerospace Fuels labs around the world constantly tested Air Force fuel to ensure their quality.

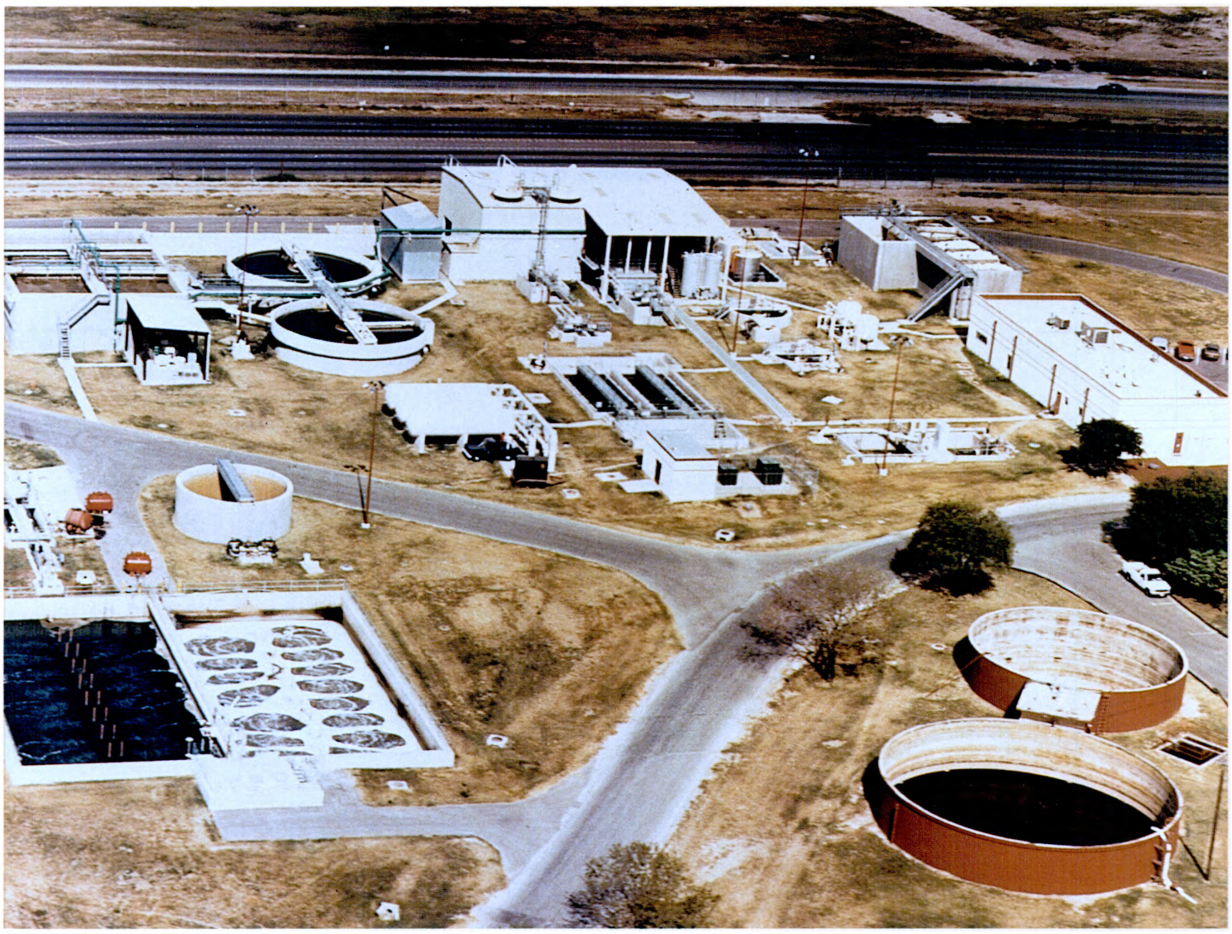

San Antonio Air Logistics Center's unique Directorate of Aerospace Fuels managed all aircraft, missile, and ground fuels for the Air Force and the National Aeronautics and Space Administration, including the propellants and chemicals used in space launches from both Vandenberg Air Force Base in California and Cape Canaveral in Florida. Many of these propellants and chemicals were classified as hazardous, requiring exemptions to federal and state laws prohibiting the transportation of hazardous materials over public highways. Despite the lethality of the cargo, Aerospace Fuels officials were proud of their record of managing over twenty-five years of shipments with no accidental release of toxic material.

Nevertheless, heightened public concern in the 1980s over the shipment of hazardous materials on the highways led to tighter restrictions, especially in environmentally conscious California. In 1984, the California Highway Patrol began dictating which routes trucks carrying hazardous cargo in California could follow. Two years later, as requirements to granting the necessary exemptions, the Department of Transportation began regular reviews of the routes traveled to ensure they avoided congested population centers and asked the Department of Defense to develop emergency response plans in case of accidents.

The issue resurfaced in 1987 as a California congressman held hearings in Los Angeles on transporting hazardous materials on public highways. In the midst of the negative publicity generated by these hearings, Mayor Tom Bradley demanded the Defense Department reroute any shipments of toxic chemicals around the southern California metropolis. Department of Transportation officials insisted Aerospace Fuels personnel find alternative routes to Vandenberg, temporarily halting any further propellant shipments.

A new route was certified in early 1988, but that only solved part of the problem. Directorate transportation specialists still had to develop an emergency response plan, with a full-time escort team, before Transportation officials would renew the expired exemptions. Developing the plan proved easier than finding a suitable escort team. Initially, directorate personnel negotiated with the Army Technical Escort Unit, but differences of opinion on what constituted a suitable vehicle closed that option. Finally, SA-ALC contracted with a commercial firm to provide emergency response escort services. The contractor team successfully escorted its first shipment in February 1989. Funding for this multi-million dollar contract came from the fuels stock fund. It was clear to everyone that the cost of "doing business" would continue to climb.

Kelly AFB's new industrial wastewater treatment plant

Environmental Management

In 1975, the Department of Defense began a program to identify environmental hazards created by the disposal of chemicals, solvents, or other waste on military installations. Known as the Installation Restoration Program, it reflected the growing awareness of environmental issues throughout the country. When Congress passed the Comprehensive Environmental Response Compensation and Liability Act in 1980, an act which was intended to pay for cleaning up waste disposal sites nation-wide (and which was better known as the "Superfund"), the military clean-up effort was already well underway.

Despite a long history of solvent and chemical use, Kelly's environmental problems were comparatively mild. Nevertheless, some areas of the base, notably the site of the "Green Worm" engine cleaning line, demanded attention. The same was true of other Air Force Logistics Command bases, and in 1986 General Earl O'Loughlin, Commander of Air Force Logistics Command, instructed all the air logistics centers to form an office to coordinate environmental issues. The Environmental Management Office at Kelly was in existence by that fall, and by 1987 it held responsibility both for developing environmental protection policies and for seeing to it that those policies were carried out.

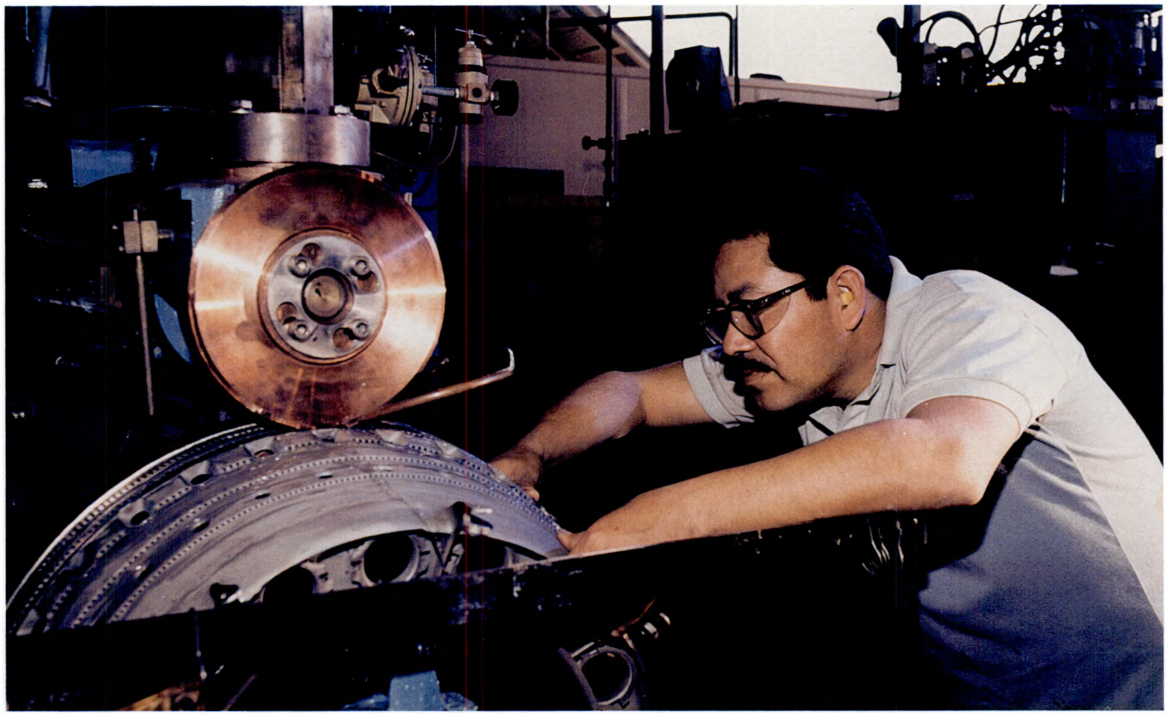

This was a tall order. Kelly generated about forty-three million gallons of liquid industrial waste annually in the late 1980s, along with around six million pounds of solid waste. Approximately forty percent of this waste was classified as hazardous. Storing and disposing of it required constant monitoring, and the issue of storage created an intense community debate. At the same time, Kelly took steps to avoid future problems through the construction of a new, larger, and more efficient wastewater treatment plant, and through the inaugeration of efforts to find non-hazardous substitutes for the chemical solvents and cleansers that were regularly used in aircraft maintenance. In an era of growing awareness that national resources had to be protected, these were only the first steps on a long, but necessary, journey.

Although all the moving was not quite finished, the new organizational structure became effective on October 1, 1990. A new Propulsion Directorate handled all aspects of engine management and repair, for example, while the Aircraft Directorate did the same for aircraft. The Directorate of Plans and Programs vanished, combining with the Comptroller's office to become the Financial Management Directorate, with a mission broadly defined to include planning as well as budgeting. Contracting and Manufacturing personnel, specialists in procurement, were matrixed into these new organizations, shrinking that directorate into a much smaller Directorate of Contracting. Two new directorates appeared--a Aerospace Equipment Directorate, which handled test and support equipment, and a Directorate of Technology and Industrial Support to control the engineering and scientific support for the other organizations. At the same time, the Directorate of Communications and Computer Systems merged with the 1923rd Communications Group to form a single communications and computer organization at Kelly. In this case, though, the smaller fish partially swallowed the larger, and the former directorate formally became the Headquarters 1923rd Communications and Computer Systems Group.

All these changes were accompanied by hundreds of people moving to new desks or new buildings, with new phone numbers and new co-workers. For weeks after the first of October personnel at the center had to consciously think about the new names attached to groups they once knew, and it was some time before all the phone and computer lines were in place for the new organizations. Moreover, Kelly personnel had little time to catch their breath despite the magnitude of the changes they had just gone through. More changes were coming.

The Continuing Impact of the DMR

The restructuring of Air Force Logistics Command did not, as some supporters of the effort undoubtedly hoped, forestall the consolidation of the command with Air Force Systems Command. In January 1991, Secretary of the Air Force Donald Rice announced that the two commands would merge into a single Air Force Materiel Command around mid-1992. In a message to the AFLC work force, new AFLC commander General Charles C. McDonald "enthusiastically support[ed] this decision," stating that it presented an opportunity to

Under the new product directorate concept, the manager of the system controlled almost everything that affected his program - maintenance, contracting, finance and management.

further improve customer support and integrate improvements in technology more rapidly. By mid-April 1991, a provisional command headquarters existed at Wright-Patterson Air Force Base and planners had settled on the basic organizational arrangement of the new command. Appropriately, its emblem would be the old Air Materiel Command emblem, a choice which served as a reminder of the heritage shared by both commands as they moved closer to full consolidation.

Integrated Weapon System Management

A key part of the newly consolidated command, the integrated weapon system management concept attempted to meld the responsibilities handled by each of the separate commands into a single "cradle-to-grave" management approach. Under this arrangement, the program manager for a particular system would be the single point of contact for all facets of that system's development, from the earliest phases of design and procurement until it was retired from the inventory. This was exactly the same thinking, of course, which had resulted in the creation of the product directorates at the logistics centers during 1990, and its goal of integrating all phases of weapon system support, from acquisition through logistics support, simply pushed AFLC's reorganization to the next logical step.

Consolidation of Depot Supply Activities

Under DMRD 902, the Department of Defense proposed to consolidate control over all supply depots under the Defense Logistics Agency, including the Directorate of Distribution at San Antonio. Officials at Kelly found this proposal disturbing on several counts. Over half of the items stocked in its warehouses, for example, were used in maintenance of aircraft and engines. In addition, a hefty proportion of the other items stored were stocked in direct support of base activities. Local officials were concerned that centralization of supply activities would disrupt support to the depot and other Kelly organizations, and actually add to rather than lower costs.

Planners expected to have a prototype organization established in the San Francisco area by July 1990. Data from the operations of this prototype (which included the distribution and supply organization of the Sacramento Air Logistics Center) would then be used to provide a framework for further consolidation. Some officials at Kelly undoubtedly hoped that this test would vindicate their view that consolidation would create more problems than it solved, but most realized that some form of consolidation was inevitable. By May 1991, San Antonio had negotiated memorandums of agreement with the Defense Logistics Agency and was making plans to transfer part of the distribution and supply operations to it during late 1991. Under these plans, a residual distribution and supply directorate would continue to handle supply for the depot.

Automated Warehouse System in the Directorate of Distribution.

Congress, though, forced a delay by including in the fiscal 1992 budget appropriation a demand for a complete analysis of the San Francisco test, especially an evaluation of the links between the different data automation systems used by each of the services. But there was still no question that both the Pentagon and Congress continued to anticipate a consolidation of supply operations. The issue was not if, but when.

Down, But Not Out

More than once in Kelly's history did the sudden mood changes of "Mother Nature" wreak havoc on base activities. Kelly personnel again were reminded of the power of the elements early on the morning of September 17, 1988, when Hurricane Gilbert struck the Mexican coast 400 miles south of Kelly Air Force Base. As the hurricane moved inland into Texas, it spawned numerous tornadoes, two of which touched down at Kelly. One of these tornadoes was responsible for an estimated $22 million worth of damage to the base.

The first tornado, which caused no damage to the base, was reported at 6:30 a.m. near the south end of the base's runway. The second tornado hop-scotched around the base, narrowly missing Billy Mitchell Village, the base housing area, before touching down and demolishing all or part of twelve buildings within the Directorate of Distribution area. The tornado destroyed an estimated 1.1 million-square-feet of storage space.

Once the threat had passed, the focus shifted from damage assessment to recovery. The Distribution area, hardest hit by the tornado, had to be cleared of debris from the warehouses, packing materials, and crates. As members of the 2954th Combat Logistics Support Squadron from Air Force Logistics Command bases arrived on the scene, they were tasked with the duties of reclamation, transportation, and inventory of all items they were able to collect. They were also responsible for packaging items including wrapping materials and building crates. Additional support arrived in the form of a thirty-nine member team from the 449th Mobility Support Squadron, Holloman AFB, New Mexico, which erected ten "Harvest Bare" portable hangers for the temporary storage of parts and other materials that were left without shelter after the tornado. Members of the Prime Base Emergency Engineering Force (PRIME BEEF) from Wright-Patterson AFB, Ohio, working side-by-side with the SA-ALC PRIME BEEF team, removed the damaged portions of those buildings destroyed by the tornado and made those salvageable buildings safe for contractors who performed the major repair work.

The support and commitment displayed by the members of the SA-ALC, the Air Force Logistics Command, and those units who assisted Kelly AFB during the days, weeks, and even months that followed the tornado were in keeping with the mission orientation of all Air Force people. Only two months after the tornado operations in the Distribution area were up to eighty percent of capacity. Within one year the directorate had almost completely recovered, showing the dedication of the people who work within the directorate.

After months of planning, Pope John Paul II arrived at Kelly on September 13, 1987.

Kelly's Distinguished Visitors

Over seventy-five years, Kelly has been a stopping point for many distinguished visitors ranging from senior military officers, such as Army Chief's of Staff John J. Pershing and Dwight D. Eisenhower, to several presidents. In recent years, the roll of Kelly's visitors has continued to grow.

The most visible of these visits was Pope John Paul II, who landed at Kelly on September 13, 1987. The visit was part of a national tour by the Pontiff, which included a stop for an outdoor mass in San Antonio. Preparations for the visit and the mass began months before, and generated immense excitement throughout the entire south Texas area. For security reasons, the general public was excluded from the base for the Pope's arrival, but was met by a large crowd of Kelly workers and their families, and many local dignitaries, including Governor Bill Clements, Archbishop Patrick Flores of San Antonio, and Mayor Henry Cisneros. Over 300,000 attended the papal mass, and after spending the night at Assumption Seminary in San Antonio, the Pope returned to Kelly and departed on September 14th.

The thaw created by Glastnost and the emergent end of the Cold War brought an unexpected visitor to Kelly two months before the arrival of the Pope. In a gesture as unexpected as anything in recent memory, the Soviet and American military exchanged visits of their respective chiefs. Admiral William Crowe was able to visit Soviet military bases, and on July 8, 1988 the Marshal of the Soviet Union and Chief of the General Staff, Sergei Akhromeyev, arrived at Kelly AFB for an overnight visit to San Antonio. The Soviet Marshal and his wife had the chance to see the Alamo, take a tour of the Riverwalk, and stop by the Institute of Texan Cultures. It was the kind of visit any tourist might have, but the visit of this tourist was a clear sign of just how much things had changed internationally by the end of the 1980s.

Her Majesty Queen Elizabeth II of Great Britain passed through Kelly on May 22, 1991 during a whirlwind, two-hour tour of the Alamo City.

General Dwight D. Eisenhower (second from left) visited Kelly on August 19, 1946.

General John J. Pershing, right, conducted an inspection of Kelly Field in 1920.

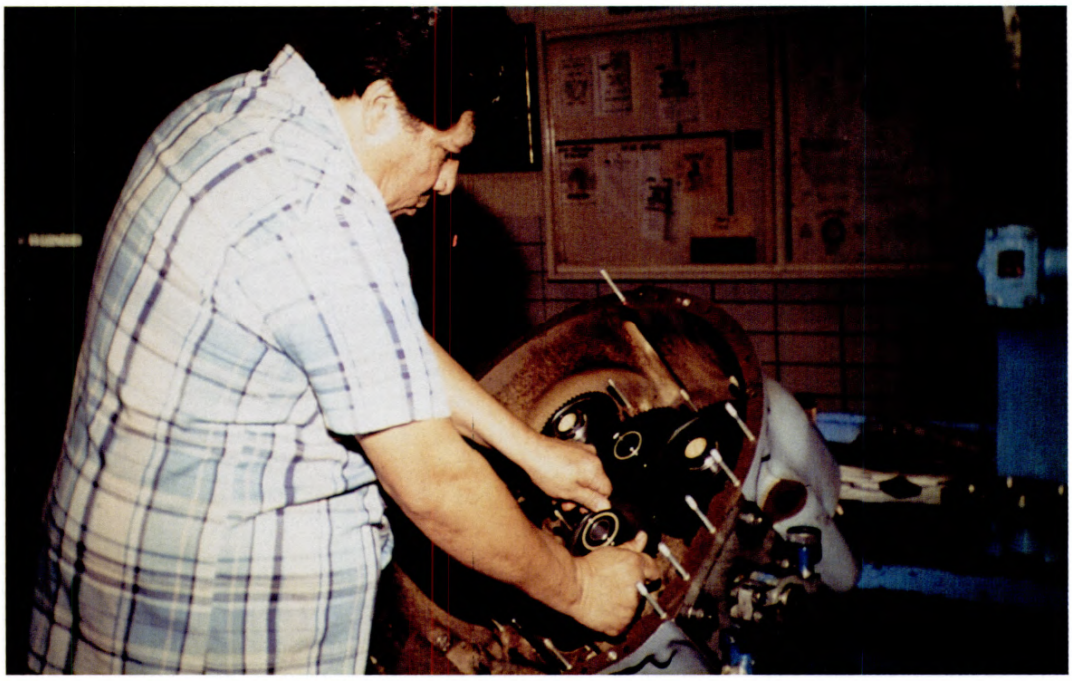

The Defense Management Report of 1989 portended major changes in Kelly's handling of aircraft maintenance.

Maintenance Competition

Consolidation of depot work loads, aircraft and non-aircraft, was another target of the DMRDs. Initially, under DMRD 908, the Air Force would take on responsibility for all aircraft maintenance, while DMRD 909 gave the Navy responsibility for all watercraft and the Army the job of managing all remaining non-aircraft maintenance, including vehicles. Pentagon planners believed that consolidating aviation maintenance might save over a billion dollars, and consolidating the management of other types of equipment might save another $770 million. All three services were reluctant, though, to hand control of their systems to another service for maintenance. All three pointed out that they had specific requirements for the maintenance of their equipment. The Air Force in particular objected to the idea of a single manager for all aeronautical systems.

Instead, at a meeting in May 1990, the Air Force joined the Navy in suggesting the creation of a Defense Depot Oversight Council, with members from all the services. As proposed, the council did not have its own staff; the existing Joint Depot Maintenance Advisory Group would provide all needed support. Using a combination of initiatives, the services would develop a baseline to measure annual savings over a five-year period. These steps would include shifting work loads between services, streamlining organizations, and, most importantly, involve competition between the various service depots as well as between them and private contractors.

Competition, in the sense of seeking the best price from a civilian contractor, had loomed as an increasingly important part of procurement during the 1980s. But the kind of competition between service depots now being proposed was something entirely new. In this respect, for the first time, government depot organizations were to behave as if they were in

San Antonio's initial candidate for competition was the T56 gearbox.

fact private companies. Success would be measured just as it would for such a company: by profit. And the effort to win competition was expected to force government depots, including the San Antonio Air Logistics Center, to improve the efficiency of their operations, lowering costs in the process.

By the late spring of 1991, it was evident that the projected savings of competition and consolidation would not match the reductions in the defense budget estimated over the forseeable future. At best, the Air Force projected a total savings of some $418 million and needed to find ways to cut another $300 million in costs. Of this, San Antonio's obligation was to find some way to cut a further $71.6 million.

Local officials argued that interservicing and reduced capacity would account for some of this, with the rest being met through competition. This might mean a loss in work load to the center, with corresponding cuts in the work force--an unhappy prospect for both Kelly and the city of San Antonio.

One of the main candidates for competition was the T56 gearbox, a work load previously scheduled for transfer. But others included such long-term mainstays as the TF39 engine (which the Navy claimed it could repair for a cost which SA-ALC officials regarded as unrealistically low), and the T56 engine. Even the C-5, the depot's largest work load,

Boning up on the TF39 engine, powerplant for the mammoth C-5 Galaxy, takes Kelly AFB Maintenance personnel into part identification of gigantic proportions. The huge engine has an intake diameter of more than eight and one-half feet.

was not immune. It was conceivable that a private contractor, such as the manufacturer Lockheed, might take on the overhaul responsibility. There were sixteen or more candidates for competition by April of 1991.

Although Defence Management Review Decision 908 did not forecast the closure of any Air Force depots, the issue surfaced in the fall of 1990 and remained a topic of speculation during 1991. Ten years earlier the notion of closing the San Antonio depot would have been dismissed as nonsense. Now, though, the uncertainty spawned by budget cuts and multiple reorganization efforts meant that the question was likely to be taken seriously. And if the depot closed, what of the base? Would Kelly itself be shut down as was happening to many other installations around the country? No one knew. Kelly's people carried on, but the future of their base was more uncertain than ever before.

Kelly Goes to War

Although sustaining Air Force units around the world in peacetime was the main activity of the San Antonio Air Logistics Center the need to prepare for wartime support was never far from anyone's thoughts. Doing so would mean a dramatic change from peacetime routine, and the demands of wartime emergencies could not be improvised at the last minute. There would be no time to build up a new routine or new organization during an emergency; plans had to be in place, and practiced, ahead of time.

While such exercises, known as Operational Readiness Inspections or ORIs, were familiar aspects of peacetime training for operational units, they were new to Air Force Logistics Command and the air logistics centers. And, at the same time, international events offered a vivid reminder that, even as the Cold War waned, the call for American military action could happen at a moment's notice.

Operational Readiness

By mid-February 1989, the San Antonio Air Logistics Center was already hard at work, preparing for their first Operational Readiness Inspection. Ogden ALC was the first AFLC base to go through an ORI and San Antonio officials studied the results closely. In addition, the local Office of the Inspector General conducted three practices evaluated by the local Readiness Exercise Evaluation Team. All three went well, as did a final practice during the Joint Chiefs of Staff command post exercise WINTEX-CIMEX in February and early March. The exercise dealt with the same areas covered in an ORI: wartime response, mobility deployment and employment, disaster response, and base security.

Less than two weeks later, from March 13 to March 23, 1989, San Antonio went through its own ORI. The results were a bitter disappointment. To keep costs, especially overtime costs, to a minimum, Major General Lewis Curtis, the ALC commander, tried to use functional experts in each directorate as players, allowing most item managers, buyers, and supply specialists to carry on their normal day-to-day activities. Many were essentially unaware that the exercise was taking place, and the limited number of exercise players prevented full-scale operations around the clock. But the AFLC inspectors did not stay in the command center; they visited the directorates where they found workers unaware of exercise requirements that affected their items. The final overall rating for San Antonio was marginal, not the excellent that participants had anticipated.

In another sense, though, this result proved positive. It forced the ALC to reevaluate how it planned to do things under wartime conditions, especially how it would orchestrate its "surge" activity--the accelerated pace demanded under emergency conditions. Indeed, center officials had caught their own mistakes during the ORI and made changes which dramatically increased their effectiveness. Unfortunately, the changes came too late to alter the outcome of the ORI.

When meetings began among officials to assess the results of the Operational Readiness Inspection and make plans for a retake (scheduled for August), they immediately altered the way they would run surge decision-making. Doing this involved reviewing the entire list of potential surge items, developing a computer data base to assist in managing this list, and stressing the need for keeping the people who handled surge items the same ones who dealt with those items daily. To test the new approach, the center practiced three times, in May, June, and July, before the Air Force Logistics Command inspectors returned on August 21.

By mid-February 1989, the San Antonio Air Logistics Center was already hard at work preparing for their first Operational Readiness Inspection.

The Operational Readiness Inspection retake ran from August 21 to August 28, and it was a complete success. Every problem area under the Air Logistics Center's control had been corrected. Surge items were accurately tracked; deadlines met; communication timely and complete. Far more personnel were actively involved in the retake, and their knowledge of what had to be done impressed the inspectors immensely. The final rating was still only a satisfactory, but that was the highest rating possible during a retake, and when they left the inspectors admitted that some of the steps taken by the center were being evaluated for adoption throughout the command. Moreover, this success could not have been timed better. It was not long before Kelly and the Air Logistics Center would get the chance to test their ability to react quickly under even more strenuous circumstances.

Operation Just Cause: The American Intervention in Panama

American relations with the Republic of Panama were based from the start on the Panama Canal, built by the United States during 1904-1914 and long considered one of the most important American military assets. In 1977, however, after several years of patient negotiation, the United States and Panama finally signed a treaty giving Panama control over the canal in 1999. Yet, despite this evidence of amity between the two countries, relations grew steadily worse during the 1980s. Following the death of Panamanian leader General Omar Torrijos Herrera in an aircraft crash, General Manuel Antonio Noreiga emerged as the effective ruler of Panama. In early June 1987, popular anger erupted in response

to a series of charges levied against Noreiga by his former chief of staff. Demonstrations were met by force, and the violence escalated. Then, on February 4, 1988, General Noreiga and fifteen co-defendants were indicted by federal grand juries in Tampa and Miami, Florida, on charges of drug trafficking. Noreiga responded with a public demand that the United States military leave Panama immediately.

For the next twenty-two months tension slowly increased as American officials tried unsuccessfully to persuade Noreiga to abandon his position. American personnel and Panamanians working for American agencies were harassed almost continuously. At first the American government was reluctant to use force to solve the crisis, largely because of the problems this would create with other Latin American governments. But the failure to negotiate a settlement with Noreiga, together with his own inflammatory rhetoric and the lingering stigma of the Florida drug charges, had pushed American officials toward a military solution by the fall of 1989. Then, in December the crisis abruptly escalated when Noreiga "declared war" on the United States; an American officer was shot and killed by Panamanian troops, and an exchange of gunfire took place between an Army lieutenant and Panamanians. In the early morning hours of December 20, 1989, American paratroopers began landing as other ground forces moved from American bases against Panamanian military strongpoints. In some cases, fighting was severe, but within a day American troops controlled the city, a democratically elected government (kept from taking office by Noreiga in the spring) was in place, and Noreiga had taken refuge in the residence of the Papal representative. Given no other option, Noreiga surrendered to U. S. troops a few days later. Contrary to official fears, the predictable Latin American complaints about the operation were muted.

Kelly's Role in Operation Just Cause

Kelly's senior military leadership learned about the operation around midnight on December 19, about the time that the invasion began. The first priority was to prepare to receive returning wounded, but officials also had to make arrangements for security, refueling transient aircraft, and customs processing for crews and troops coming back from Panama. No specific plan existed to deal with all these issues, and solutions had to be developed rapidly. Adding to the complications was the weather; it was bitterly cold in San Antonio, with the outside temperature hovering below twenty degrees farenheit.

Troops stopped off at Kelly on their way home from Panama.

Despite these handicaps, things came together well. Officials chose the large operations hangar, building 1610, to be the reception center. The building was not well heated, but within a few days tents were up inside the hangar. The temperature inside the shelters was kept up by piping warm air into them from gasoline operated heaters set up outside. Inside the hangar as well was a command post, set up to handle what was locally known as Operation Spur.

Initially told to prepare to refuel nine aircraft, Kelly handled over twice that many within the first twenty-four hours. Food service personnel worked frantically to prepare food for the troops on board, providing fresh box lunches until it became clear that it was simpler to bus the troops to the mess hall while their aircraft was refueled. By mid-morning of the 20th, wounded were arriving, too. Medical personnel quickly established procedures to get them on their way to Wilford Hall, the Air Force medical center on Lackland Air Force Base, or the Brooke Army Medical Center at Fort Sam Houston.

Refueling Operations in Support of Operation Just Cause

The support provided by SA-ALC's Directorate of Distribution's Fuels Management Branch established a new record for aircraft servicing rates in the support of Operation Just Cause. The initial aircraft surge started on December 20, 1989 at 0215 hours continuing through December 27th. During this period 109 C-141's and twenty-eight C-5 aircraft were serviced with a total of 2.0 million gallons of JP-4. This is significant in the fact that the normal monthly consumption rate is only 2.4 million gallons. The fuel support posture at the start of the operation was limited to twelve refueling vehicles and augmented by four Randolph Air Force Base refueling vehicles towards the final stages of the operation. Had the North Ramp Hydrant System been in operation--it was out of commission for add-on construction--fuel support would have been enhanced significantly. The existing fuel servicing rate would have increased from 36,000 gallons per hour to 108,000.

On the peak aircraft servicing day, December 23, 1989, twenty-five C-141's and ten C-5 aircraft were serviced with an average fuel load of 13,400 gallons per C-141 and 25,000 gallons per C-5 aircraft. The twenty-five C-141s that were serviced required an average of three truckloads (4,500 gallons per load) and the C-5's six per aircraft for a total of 135. Because the distance between the aircraft parking ramp and the bulk fuel storage area required an eight mile turnaround, each truck logged an average of ninety miles transporting fuel. For the peak day, 1,100 miles were logged and 4,000 for the entire operation. This signifies the massive effort that was required in supporting the fuel requirements on the peak day. In retrospect, the fuel support for "Just Cause" was a tremendous effort especially in view of the fact that all aircraft refueling was accomplished by truck.

Another factor that was central to mission support was the extensive commercial fuel resupply effort. During one forty-eight hour period, 100 commercial tank trucks were off-loaded into tankage for a total of 890,000 gallons. Throughout the entire operation, 214 were off-loaded for a total of 1.9 million gallons.

Enhancement factors that for the most part were not applied, were the multiple truck aircraft servicing and concurrent refueling options. On the multiple truck option, all C-141's could have accommodated refueling and up-loading or down-loading of aircraft. As it was, refueling vehicles were standing by to refuel while passengers and cargo were processed. Both options were available but not requested. We speculate that aircraft crews were manned to refuel by hydrant where only one crewmember is required to monitor the single point nozzle. This limitation did not allow multiple truck servicings which may have contributed to delays in fuel onloading operations. In addition, more reliable aircraft flow schedule information would have aided in preplanning fuel support measures. In summary, despite "Just Cause" being initiated on a no-notice basis, personnel responded in a highly dedicated manner and provided exceptional support.

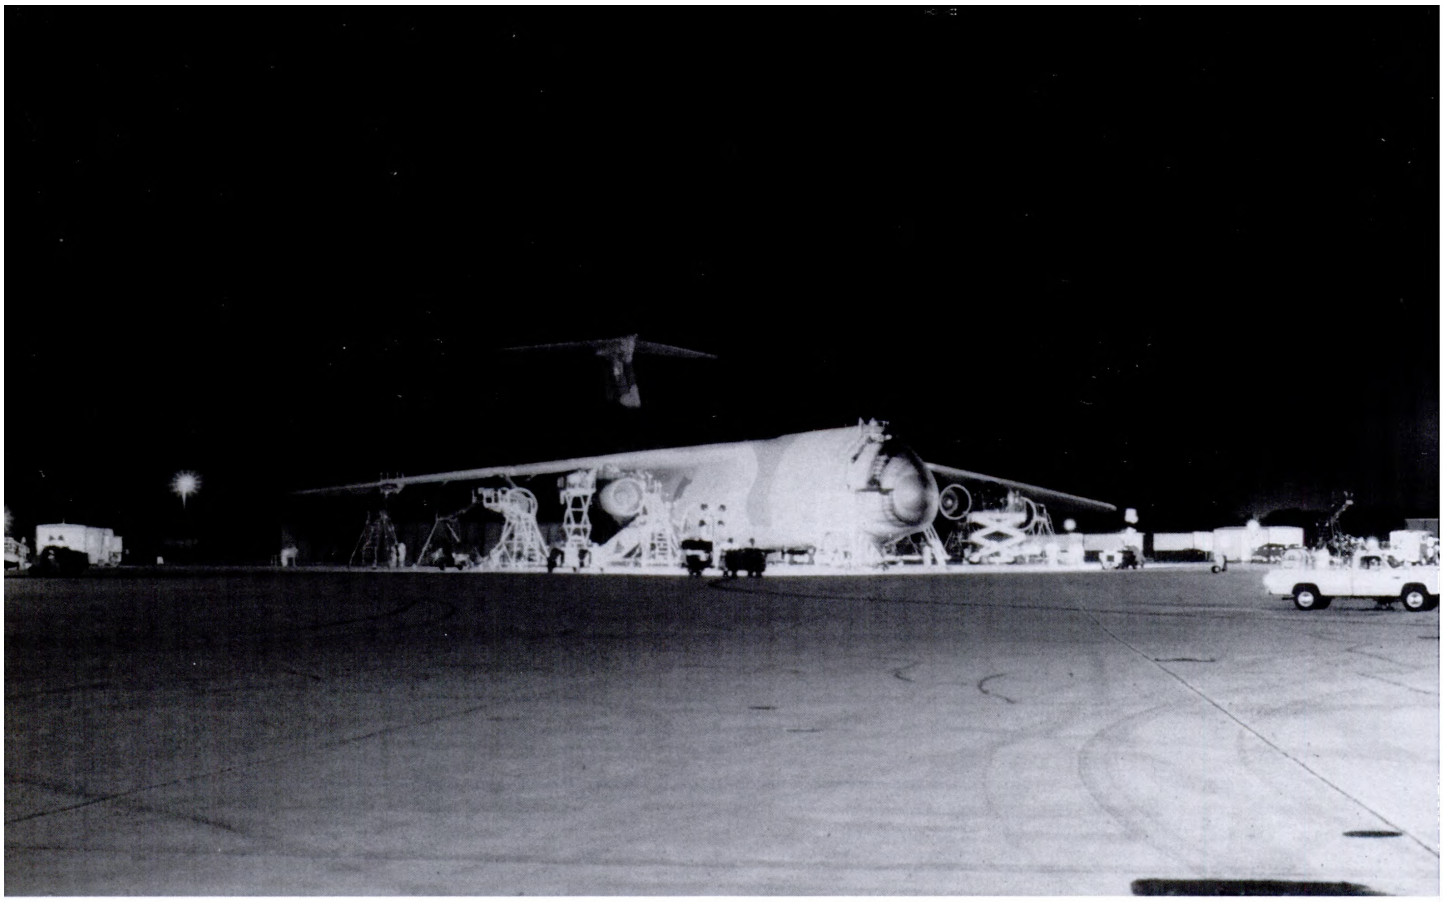

By the time Kelly's actions in support of Just Cause ended in February 1990, over 275 aircraft had passed through, carrying some 5,500 personnel and 250 tons of cargo. On the peak day of operations, December 23, 1989, Kelly serviced thirty-five aircraft. Base personnel provided as many as 10,000 meals and dispensed over two million gallons of jet fuel along with 11,000 gallons of ground fuels. Medical personnel processed 268 casualties through the temporary facilities in the operations hangar, coping with temperatures that fell to near zero at one point. By any measure, Kelly's efforts on behalf of Just Cause were an outstanding success.

A recently-arrived C-5 from Panama is refueled and readied for its continuing trip home.

Tents set up in building 1610 received heat from temporary gasoline-operated heaters.

Surging C-5s for Operation Desert Shield/Desert Storm

War in the Desert:

Operation Desert Shield/Desert Storm

The San Antonio Air Logistics Center was already well into PACER STRIDE by the time Just Cause ended, with further reorganizations triggered by the DMR on the way. The attention of center personnel was naturally on the internal changes being wrought by these reorganizations and the foreseeable impact of budget cuts and force level reductions coming as a result of the political shifts in Eastern Europe. Then, on August 2, 1990, Iraq invaded the small Persian Gulf kingdom of Kuwait, and the San Antonio Air Logistics Center found itself abruptly at war once again.

In an unprecedented step, the Kingdom of Saudi Arabia agreed to allow foreign forces on its soil; and, on August 7, President George Bush ordered American forces to the Gulf. Their initial purpose was to defend Saudi Arabia from what appeared to be the imminent threat of invasion, and, aptly, the code name for the deployment was Desert Shield. The United Nations voted to impose economic sanctions on Iraq on August 6; and over the next few days Middle Eastern and European nations joined the growing military coalition. On August 22, President Bush authorized the first call-up of reservists to bolster the American presence in the Gulf, and three days later the United Nations voted to authorize the use of force to enforce its resolutions.

The flow of men and material into Saudi Arabia went on non-stop, with volunteers from reserve units flying missions in support of active duty and activated reserve units. On August 28, a C-5 flown by volunteers from the 433rd Military Airlift Wing, based at Kelly, crashed on takeoff from Ramstein Air Base, Germany. Ten of the seventeen people on board were members of the 433rd, and nine died in the crash. News of these fatalities brought the reality of this new war home to everyone in San Antonio.

The Build-Up

On August 9, 1990, the San Antonio ALC began operating its Logistics Readiness Center around-the-clock, put its surge contingency plan into effect, and implemented the base mobility plan. Other emergency and wartime plans went into effect within the month as the demand for troops and material grew. To keep center personnel up-to-date on the activities

of the center, the base Public Affairs Office began publishing a weekly Desert Shield Digest. Maintenance workers accelerated repairs to C-5 and B-52 aircraft, operating around-the-clock seven days a week. The pace of repair for TF39 and F100 engines increased. By the end of January, Kelly maintenance personnel had put in 23,000 hours of overtime in support of Desert Storm, and the level of effort showed no signs of slowing. In many offices, television sets or radios tuned to news stations provided a steady background of information on events.

Perhaps the most surprising development was the fact that the allied build-up in Saudi Arabia was unhindered by Iraqi action. As the threat of an invasion of that oil rich kingdom faded, the prospect of an assault on the Iraqi troops dug in along the southern border of Kuwait loomed ever larger. But equally surprising was the willingness, however reluctantly, of the Soviet Union to accept and verbally support the coalition effort. For the first time since the end of World War II, the United Nations was in a position to take united action against an aggressor nation.

Kelly people's work on F100, TF39, and T56 engines was so successful that not one fighter, attack, or transport aircraft missed a sortie during Desert Storm because of a lack of Kelly-furnished spare parts.

By mid-October the flow of supplies and munitions out of Kelly was moving so smoothly that officials reduced operations in the readiness center to twelve hours during the week and eight on weekends. For a time the pace of events seemed to slow as various diplomatic manuevers dominated the news, but American and allied troop strength in the Gulf continued to grow. In early November another 150,000 American troops were sent to the region. Call-up of Reserve and National Guard units continued. Then, on November 29, the United Nations Security Council voted to give Iraq six weeks to withdraw. Following that date, the coalition would be free to undertake military action. A final flurry of diplomatic moves followed, with Secretary of State James Baker unsuccessfully attempting to set up a meeting with Iraqi leader Saddam Hussein and United Nations Secretary General Javier Perez de Cuellar flying to Baghdad for a last ditch effort to avert fighting. Americans listened and watched as Congress solemnly debated the commitment of U. S. troops, a step authorized on January 12, 1991. Effectively the die was cast.

Desert Storm

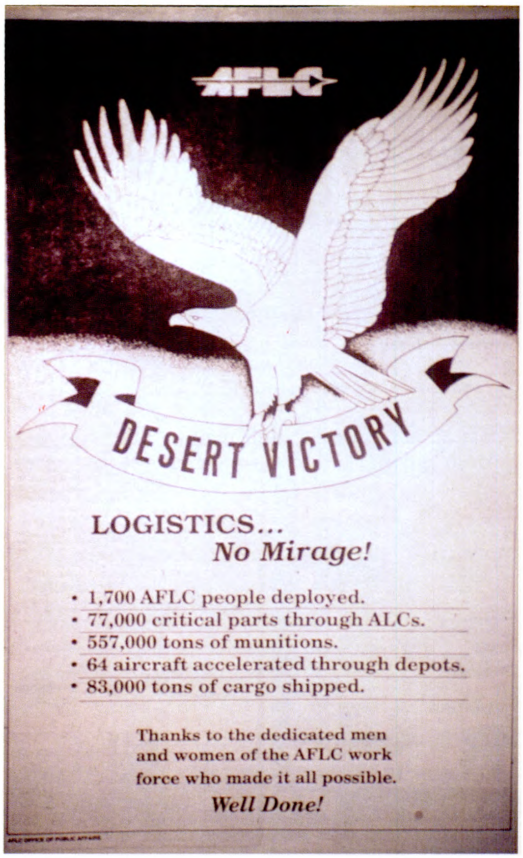

The deadline for the start of military operations was January 15. It passed without any action, and for a moment the tension eased. Then, around midnight on the night of January 16, Baghdad time, the allies struck. It was about six o'clock in San Antonio when the news of the first Allied air strikes reached workers just sitting down to their evening meal, and within moments Kelly was galvanized into activity. Tightened security went into effect immediately. Traffic jams backed up at the gates as security police checked individual identification cards. Once again, radios and television sets were tuned to news stations.

The air war over Iraq went on for five weeks. The moment most awaited and feared came on February 23 when allied ground forces began their assault. Incredibly, Iraqi resistance collapsed with stunning speed. One hundred hours after it began, the ground war ended with a ceasefire. The Iraqi army was completely beaten; Kuwait was liberated; and Saddam Hussein forced to agree to twelve United Nations resolutions--agreeing, among other issues, that the invasion had been wrong and accepting financial responsibility for the destruction to Kuwait's oil fields. It was a stunning military achievement.

Return of the First Desert Storm Troops

Excerpts from an Interview with
Maj. Gen. Richard D. Smith

The first Desert Storm aircraft was an Army unit, a 747 coming in, scheduled at about 8:00 p.m. the first night. We hadn't laid any plans, really, for them to come back; we only found out it was coming in two days before. I checked with Fifth Army, who was going to receive the troops. They were going to put them on buses and take them over to Fort Sam Houston. I called the commander, confirmed this, and said, "That's not what we really want to do. We don't want them to ride a bus, for God's sake. In fact, we'll make it an Army show. Let's have it in building 1610, the same building we had received casualties in.'" General George Stotzer, Fifth Army Commander, said, "You're absolutely right; let's do it. " So we set it up out at the airfield in the evening. The airplane wouldn't get in until late; the Army Reserve outfit went out there and set up. There were literally thousands of people to meet the troops ; there were 457, if I recall, on the airplane. I won't say logistically that we did it all right because we didn't have places to take their weapons and all these kinds of things.

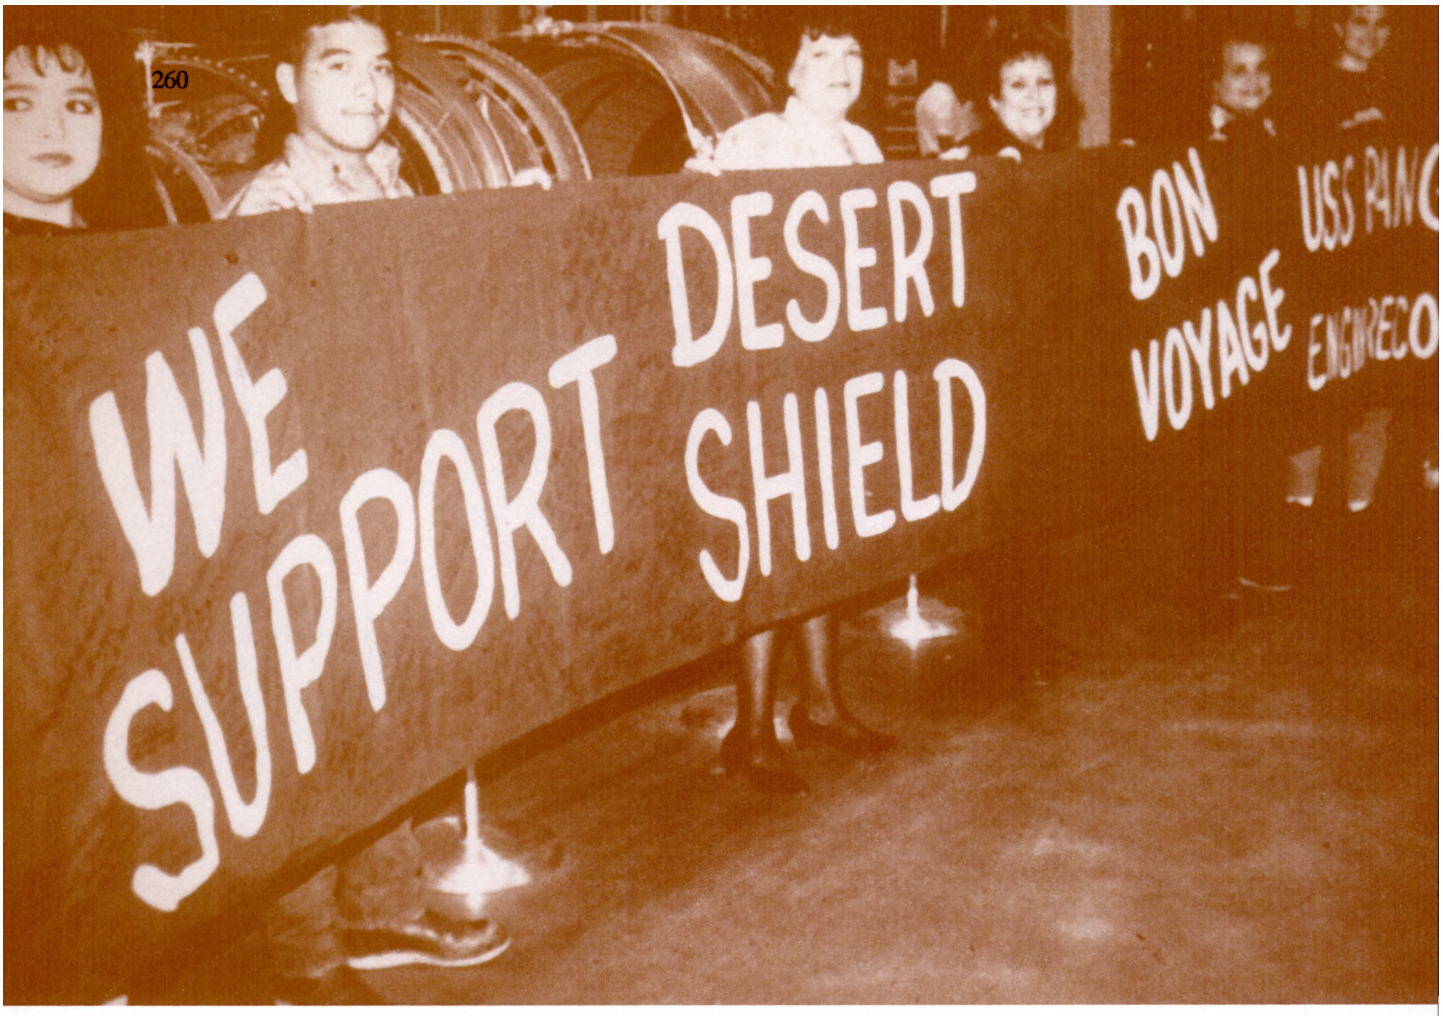

The air was electric from 8:00 o'clock on. With a six-hour wait, we tried to get the word out to people that the airplane was going to be late, but there were still people waiting at the hangar at 8:00 -- virtually a full crowd. For three hours we probably had about two thousand people, and they all had their flags at their side. They'd put big signs up over the walls and doors that said, "Welcome Home," and "You kicked butt." They'd hung an American flag out in the back. The Army band sat outside and played music and gave concerts. We had Coke and hot dogs and things for the kids , and I wandered around and talked to them, and they were all excited because the men were coming home. The airplane came in and landed about 2:00 a.m., and when it landed, as it turned down at the end of the runway, it came back and taxied in, and they opened up the canopy and put a great big American flag on it. The follow-me truck went out there and it had an American flag and a Texas flag on the back, and it brought the airplane to its chocks, and, of course, the crowd cheered when the airplane touched ground, and it cheered when they did the chocks.

We put the stairs up against the plane and all the Pan-Am stewardesses came down; each one of them had an American flag, and they lined the steps of the airplane. General Stotzer and I went up on the airplane to give the returning men their systems briefing. The band played "God Bless America," and when we looked back at the lights on the hangar and the crowd there, people cheering and waving flags, the music, the signs welcoming the troops home, and all of it-- it was extremely moving. We went into the airplane and gave our briefing -- 'You go home with your families; you can pick up your bags in two or three days. If you don't have families we have buses to take you over to Fort Sam Houston to spend the night." It was a Thursday and we wanted them to report in on Monday and we told them what was going to happen with their unit. And, after we finished, the commander, who was an Army colonel, got on the speaker system and asked everybody to stand and he said, "I want Vietnam vets off the airplane first. We're home.'" I don't think I've ever been as moved as when I saw the men getting off the plane. We repeated that fourteen times; we welcomed them all that way.

The Kelly peoples' support for American troops was heartfelt.

Kelly's Gulf Support

The logistics effort in support of American deployment to the Persian Gulf was enormous by any measure. Half a million troops were on the ground by the end of the ground fighting, supported by hundreds of aircraft, and backed by millions of tons of supplies. The San Antonio Air Logistics Center played a key part in this effort, overhauling ten C-5 aircraft and five B-52s ahead of schedule and accelerating the repair of critically needed engines. In addition, the center shipped out over seventeen million pounds of munitions aboard 283 aircraft, supported the deployment of over 4,600 passengers, surged over 72,000 items requisitioned by American and Allied air bases, and procured over 915 million gallons of aviation fuel. In one specific instance, Kelly first learned of the immediate requirement for a multi-man cooling system (vital if the Iraqis used chemical weapons) in August, delivered the first lot in September, and completed production in December. What would take seven years under normal cicumstances took just five months.

Many of Kelly's people did more than coordinate logistic support. One hundred and thirty-one ALC personnel deployed to the Gulf, including members of the 2851st Security Police Squadron and the 2954th Combat Logistics Support Squadron, while another 329 members of associated units went to the Gulf from Kelly. Over 200 Kelly workers were called to active duty as part of activated Reserve or National Guard units. As they had so often in the past, Kelly's men and women had once more responded when called. And, upon reflection, the center was grateful for the long, hard round of exercises they had gone through the year before. Practice, in this case, made perfect.

Toward the Future

Overshadowed by the national euphoria over the dramatic victories in Operation Desert Storm, the same factors already forcing changes in the

American military structure continued to operate. Even as the troops in the Gulf began coming home, Pentagon planners were preparing for major cuts in strength and funding. With the threat of short-notice global war receding, planners were formulating a new series of strategies based on the development of "crisis response" forces instead of the forward defense posture utilized over the previous forty-five years. The goal was to provide as much flexibility as possible within the tight budgets of the future and involved a complete restructuring of the existing military command organization. None of the services was entirely happy with this approach; fears about the erosion of readiness were coupled with the psychological trauma of dealing with large cuts. But there were no other real choices; the cuts were coming and the services would have to deal with them.

As part of this planning, the Air Force anticipated keeping only three fighter wings in Europe and a similar number in the Pacific. In contrast to the Army and Navy, most of the Air Force cuts aimed at the active-duty forces. By the mid-1990s, Air Force planners anticipated having fifteen active-duty wings and eleven Reserve or Air National Guard wings. Beyond this, Air Force Chief of Staff General Merrill McPeak favored the creation of so-called composite wings, combining tactical, strategic, and support aircraft in the same organization in order to provide maximum flexibility. For the same reason, Strategic Air Command, Tactical Air Command, and Military Airlift Command were to be restructured into only two commands, initially labeled "Air Mobility Command" and "Air Combat Command." How this type of restructuring would change overall numbers was an open question, but at minimum by 1997 the Air Force expected to lose 4,800 military personnel and at least 20,000 civilian employees.

The Impact on Kelly

Altering the number, size, and organization of operational units would inevitably have an impact on the San Antonio Air Logistics Center. A smaller Air Force would have less need for maintenance and supply support. At the same time, the changes being wrought through the DMR would continue to force the center to modify its way of doing things. Smaller work loads and streamlined operations offered the unappetizing prospect of eliminating jobs or, at the least, limiting the number of higher ranking positions open to employees.

Kelly's future depended on highly skilled and capable work force.

Aerial of the San Antonio Air Logistics Center, 1991

Yet the picture was not entirely bleak. A plan to upgrade the F100 engines of the F-15 and F-16 fleets to a single standard promised a continuation of F100 work for the foreseeable future, and the heavy use of C-5 transports also meant a continuation of TF39 engine and C-5 maintenance work loads--both a large part of the center's traditional responsibilities. Moreover, Kelly was an important element in the ongoing computer revolution within the Air Force. Local computer specialists were making tremendous strides in the development of artificial intelligence and "expert systems," programs that guided workers through specific processes in everything from repair work to administration. These were all signs that fundamentally the center was on the proper course, its people and organizations reacting with vigor and innovativeness to the changing environment of the 1990s.

Thus, as Kelly approached its seventy-fifth anniversary, it faced the future with guarded optimism. While many reminders of the past were visible on the base in the form of buildings and static displays, Kelly was in the process of transforming itself into a more efficient, modern facility, capable of handling new and unknown challenges.

Change is always unsettling, but over its history Kelly had seen many changes. What remained constant was the determination of its people to carry on the heritage of service that had always been Kelly's hallmark. That, at least, would not change, and it is a legacy that Kelly people carry proudly forward into the future.

Texas Air National Guard
149th Tactical Fighter Group

The Texas Air National Guard's 149th Tactical Fighter Group began as the 182nd Fighter Squadron on October 6, 1947, at Brooks Field, a direct descendant of the 396th Fighter Squadron, activated in June 1943. The 396th served in Europe during World War II, flying missions over Normandy, Northern France, Belgium, and the Rhineland in Germany.

The 182nd began flying P-51 "Mustangs" in 1947 and accepted its first jet fighter, the F-84E "Thunder Jet," when the squadron returned to active duty during the Korean War. As a part of the 136th Fighter Wing, the 182nd was the first Guard squadron to see combat during the Korean War, the first Guard unit to shoot down a MIG-15, and the first to prove the concept of aerial refueling during combat.

In 1960, when new squadrons and a headquarters staff were added, the 182nd was redesignated as the 149th Fighter Interceptor Group, with the 182nd Fighter Interceptor Squadron as one of its subordinate units. The group moved to its new home on Kelly AFB as the runway at Brooks closed.

The Group's aircrews have flown a wide variety of fighters over the past forty years including F-80 "Shooting Stars," F-86 "Sabre Jets," F-102 "Delta Daggers," F-100 Super Sabres," and F-4C "Phantoms." The 149th converted to F-16 "Fighting Falcons" during the latter half of the 1980's.

P-51 "Mustang"

More than 1,100 men and women comprised the 149th and proudly served in two important roles. In times of war, the unit served the nation as a ready and able fighting force, poised to mobilize and carry out the mission of preserving peace. In times of peace, the 149th assisted communities throughout the state of Texas by providing medical support, emergency communications, search and rescue operations, and a variety of other vital services.

The 149th converted to F-16 "Fighting Falcons" during the latter half of the 1980's.

The Alamo Wing

On October 17, 1951, 200 Air Force reservists gathered on Brooks Air Force Base to form the 907th Pilot Training Wing, christened the "Alamo Wing." Two years later, the 907th was deactivated; its personnel and nickname went to the 8707th Pilot Training Wing, where aircrews flew C-46 "Commandoes," C-45 "Voyagers," AT-6 "Texans," and T-28 "Trojans." In 1955, the 8707th deactivated , and its personnel assigned to the newly reactivated 433rd Troop Carrier Wing, which became the new Alamo Wing. Its aircrews now flew C-119 "Flying Boxcars." When the runways at Brooks AFB closed for the last time in 1956, the Alamo Wing moved to its new home and present location - Kelly Air Force Base.

Beginning in 1966, the Alamo Wing replaced its aging C-119s with the C-124 "Globemasters." A year later, on July 1, 1967, the 433rd became a tactical airlift wing. During the reserve recall during the Pueblo Crisis in 1968, the Alamo Wing was reassigned to the Miltary Airlift Command. In 1971, the Alamo Wing began flying the workhorse of the Air Force, the reliable and versatile C-130 "Hercules." With the C-130, the wing flew humanitarian missions, fought forest fires, and participated in exercises in Greece and Panama.

In 1984, the biggest announcement in the wing's history came out of Washington, D.C. -- the Alamo Wing would be the first unit in either the Air Force Reserve or the Air National Guard to be assigned the giant C-5 "Galaxy." In keeping with the C-5's global mission, the Alamo Wing became the 433rd Military Airlift Wing. The first of the huge birds arrived in December 1984 and appropriately was named "The City of San Antonio." Aircrews of the Alamo Wing continued its humanitarian missions, transporting tons of food, firefighting and farm equipment, and emergency relief supplies all around the world.

But the Alamo Wing performed its primary mission, also. In December 1989, as American forces moved against the Panamanian dictator Manuel Noriega, Alamo Wing reservists were among the first to go into action during Operation Just Cause. Less than a year later, reservists of the Alamo Wing heard their country call yet again as wing personnel were involved in Operation Desert Shield from the beginning, providing airlift support to the area of operations in Southwest Asia. Aircrews flew nearly 2,500 sorties with approximately 13,500 flying hours, hauling more than 61,000 tons of cargo and 31,000 passengers.

The greatest sacrifice occurred early in the deployment when a C-5 flown by an Alamo Wing crew crashed during take-off in Germany while transporting supplies to Saudi Arabia. Of the seventeen people aboard, nine of the wing's crew members and four passengers were killed. From just a few hundred reservists in 1952, the Alamo Wing has more than 3,500 dedicated men and women who have proved time and again that they are true to the Air Force Reserve motto, "Ready Now!"

Air Force Intelligence Command

The Air Force Intelligence Command provided electronic combat support and operations security to Air Force units worldwide and furnished direct intelligence support to the Air Force, Joint and Allied commanders and national agencies to help them perform their missions. The command traced its origins to 1948 and the establishment of the United States Air Force Security Service (USAFSS), which provided cryptologic support for the fledgling Air Force. Several months later, the Army transferred three mobile radio squadrons (one each in Germany, Japan, and the continental United States) and a radio security section to USAFSS. In May 1949, the Headquarters moved to Brooks Air Force Base in San Antonio and later moved into its new building on Kelly in 1953. In 1958, USAFSS assumed base support functions at a number of locations throughout the world.

Early in 1967, as the tempo of the war in Vietnam increased, USAFSS picked up another role, that of a central evaluating agency for all Air Force electronic warfare activities. This mission increased in importance during the 1970s, and USAFSS activated a new Air Force Electronic Warfare Center at Kelly as a result. On October 1, 1978, USAFSS ended twenty years of base management when it transferred responsibility for its last four overseas bases to the theater commands. Three months earlier, it handed over responsibility for cryptologic training, located at Goodfellow Air Force Base, Texas, to the Air Training Command.

On August 1, 1979, the United States Air Force Security Service changed its name to the Electronic Security Command (ESC), reflecting a new command, control, and communications countermeasures tasking and broader electronic warfare responsibilities. In 1985, ESC picked up another new mission, computer security, with the transfer of the Air Force Computer Security Office from Gunter Air Force Station, Alabama, to Kelly.

Twelve years later, on October 1, 1991, the command was redesignated yet again, becoming the Air Force Intelligence Command when the people and missions of ESC combined with those of the Air Force Foreign Technology Division from Wright-Patterson Air Force Base, Ohio; the Air Force Special Activities Center at Fort Belvoir, Virginia; and elements of the Air Force Intelligence Agency in Washington, D.C., to form one single command.

Air Force Commissary Service

At the end of World War II, each of the military services made its own regulations for commissaries -- stores that sold grocery items to its personnel and family members. With the establishment of the Department of Defense in 1947, some form of centralization was inevitable within the Air Force. The major commands set their own commissary operating policies and procedures, with each base managing its own store. This was usually not cost effective and often became counterproductive with substandard facilities, remote site delivery problems, poor service, and the inability of small stores to receive price reductions based upon sales volume. A 1975 Defense Department study attributed these shortcomings largely to the lack of professional training, standardized procedures, and a centralized organization.

As a result, the Defense Department established the Air Force Commissary Service (AFCOMS) in January 1976 to overcome these problems within the Air Force. The headquarters, located on East Kelly, began operating with a small cadre of key personnel in April before officially assuming control of all Air Force commissaries on October 1, 1976.

Following its establishment, AFCOMS began building new facilities and modernizing its existing stores. By 1989, of 145 Air Force commissaries in operation, seventy-five were new. State-of-the-art methods of grocery management, scanners and computerized inventory methods, were used to cut costs and streamline operations. The headquarters staff managed the wartime subsistence mission and peacetime operation of commissaries as well as interfacing with local and national vendors to obtain discounts, promotions, and the best prices possible. But the tide of centralization did not stop with just consolidated operations within one service. Congressional budget cutbacks forced the Defense Department to look at centralizing all commissary operations. On October 1, 1991, AFCOMS officially consolidated with the commissary functions of the other services to form the new Defense Commissary Agency, headquartered at Fort Lee, Virginia.

The Air Force had pushed to locate the new agency's headquarters at Kelly. While that did not happen, the San Antonio location remained important. The former AFCOMS building on East Kelly became a regional headquarters for the new agency and included a service center that paid bills and salaries for all commissary operations located from the Mississippi River to Japan. While the organization changed, the mission remained the same -- providing the best rations available to American service members and their families in war and peace.

Air Force News Center

In today's information age, another associate unit headquartered at Kelly, the Air Force News Center (AFNEWS) -- formerly the Air Force Service Information and News Center -- played a major role in keeping Air Force members and their families worldwide informed on important Air Force programs and policies.

The center created and furnished public affairs products and services through several programs: the Air Force Internal Information Program, which managed and operationally controlled the Army and Air Force Hometown News Service; the Air Force Broadcasting Service, which provided the people, equipment and coordination necessary to get curent news and entertainment programs to overseas audiences; the Internal Information Directorate, which handled news mediums that include magazine and newsletter formats, radio programs, letters and colored lithographs; and the Air Force Hometown News Center. Additional functions of AFNEWS included providing budgetary, supply and administrative support for the Air Force Orientation Group at Gentile Air Force Station, Ohio; and Air Force Regional Public Affairs Offices in Chicago, Los Angeles and New York City.

The importance of AFNEWS came to the fore during Operation Desert Shield/Desert Storm, when its personnel set up and operated the Air Force Desert Storm hotline. With the twenty-four hour information line, over 60,000 callers got news about family and friends serving in the Persian Gulf region, getting reassurance from a "real" person instead of a recorded message.

On October 30, 1991, AFNEWS held a groundbreaking ceremony on East Kelly, symbolizing the end of planning and the start of construction on a new $4 million headquarters building. When completed, more than 160 people currently located in three separate buildings on Kelly will be able to move into the single, 40,000 square-foot facility and perform their job of keeping the Air Force informed more efficiently and effectively.

CHAPTER NINE

THE PEACE DIVIDEND

The Cold War Melts

With the fall of the Berlin Wall in November 1989, the Soviet Union began to disintegrate. First, Eastern European and Baltic nations, under the yoke of communist rule for half a century or more, declared their independence. Soon even longtime Soviet states, from Armenia to Uzbekistan, began to break away from Moscow's rule.

By the time Kelly AFB celebrated its seventy-fifth anniversary in November 1991, change was a familiar way of life, and it continued at break neck speed. For the first time in forty-five years, the United States was faced with the necessity of framing a defense strategy in the absence of a clearly defined threat, but that did not mean the world was a safe place. Although the early '90s saw the United States and the former Soviet Union exchange handshakes instead of threats, there were other factions around the world intent on trading bullets. Animosities, most centuries old, flamed into open warfare.

Nevertheless, American leaders grappled with redefining the country's relationship with the rest of the world, balancing military needs against tighter and leaner budgets. Civilian leaders, both in Congress and the Defense Department, argued that the services could and should operate under the same conditions as private enterprise. Air Force logistics managers found themselves caught in the middle of this on-going debate. While it is an essential element of the art of war, many of the things logisticians do—writing contracts, computing requirements, paying bills—appear on the surface to be business type things, an apparent similarity which shaped the perceptions of senior government officials. With the specter of the federal deficit constantly in the background, Congress and the American people expected a peace dividend following the end of the Cold War, an expectation which forced the military to consider not only operational capability but also the cost of providing those capabilities. For the military, survival in the '90s meant adopting the business practices of competition, consolidation, and centralization.

Kelly's "Texas-sized" hangar, building 375, proudly displays the new emblem of the San Antonio Air Logistics Center.

In attempting to reconcile continuing security needs with declining budgets, each service adopted its own way of organizing for the post-Cold War era. The Air Force chose to make the most fundamental organizational changes since 1947. On June 1, 1992, the Air Force inactivated the Cold War warriors Strategic Air Command, Tactical Air Command, and Military Airlift Command. Taking their places were Air Combat Command (ACC), a composite organization consisting of fighters, bombers, reconnaissance aircraft, intercontinental ballistic missiles, and some tankers, and Air Mobility Command (AMC), with the majority of the tankers and transport aircraft. The creation of ACC and AMC brought the Air Force into an era of integrated airpower: the two commands were organized in peacetime as the service would fight in war.

On July 1, 1992, Air Force Materiel Command (AFMC) became a reality, integrating the sustainment, acquisition, and research and development missions from Air Force Logistics Command (AFLC) and Air Force Systems Command (AFSC) into one command for the first time since the early 1950s.

The SA-ALC commander, Major General Lewis E. Curtis III, believed it was important to keep the Kelly work force informed.

New Management Framework

The new command consisted of approximately 125,000 military and civilian employees assigned to 19 locations across the country, including 13 bases operated by AFMC. Its people operated four major product centers, four laboratories, three test centers, and five logistics centers, as well as five other specialized centers and agencies. Air Force Materiel Command also assumed responsibility for over half the Air Force's total budget. Melding the diverse missions, responsibilities, and command cultures together required a new philosophy, and leaders from the two commands were ready.

Even before AFMC was created, AFLC and AFSC leaders had focused jointly on a concept they hoped would solidify the union of the two commands—Integrated Weapon System Management (IWSM). Planners saw IWSM as a logical approach to managing a weapon system over its entire life cycle, or cradle-to-grave in the parlance of the time. Command planners built IWSM on a new management paradigm: customers became the reason for AFMC's existence. The command's first goal became satisfying the customer's needs in war and peace. An important aspect of this was the integrated product team, which was composed of multidisciplinary functional members. Metrics, or measurable parameters that indicated the health of the process being tracked, provided a new form of control.

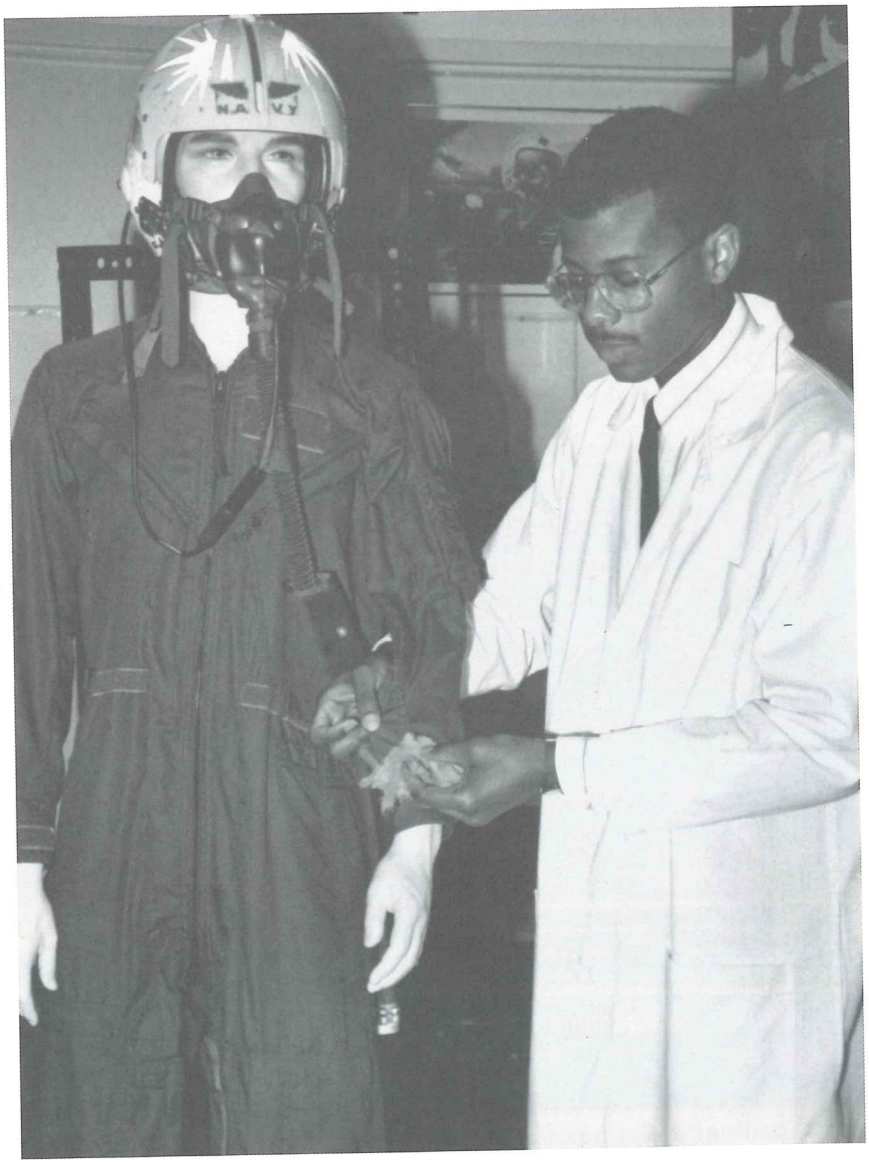

Furthermore, the AFMC planning model introduced managers to two new concepts: mission element planning and a corporate review system of quarterly meetings with commanders and functional leaders. Planners established a corporate structure with five mission element boards (MEB) to help manage diverse command responsibilities: product management, support and industrial operations, science and technology, test and evaluations, and base operating

support. The MEB process brought a multilateral perspective to decision making. No policy in AFMC was set until each of the field commanders had a chance to vote on it. In fact, as the command stood up in 1992 and 1993, commanders in the field were inundated with requests to vote on a wide variety of topics ranging from the proper placement of the personnel function to the depot maintenance workload assignment process.

Kelly personnel struggled to adjust to the new command management structure while center leadership sought to redefine and realign the local organization and management framework to fit the command's. In October 1992, the SA-ALC commander, Major General Lewis E. Curtis III, established a "Business Board" to implement decisions resulting from the strategic planning process. Within a year, the Business Board had evolved into the SA-ALC Corporate Council, a management forum to establish ALC-wide policies, plans, directions, and metrics.

During AFMC's first year, command leaders worked to understand program management under IWSM. By January 1993, center planners had sorted out how SA-ALC's responsibilities fit in with the new concepts. Initially, SA-ALC had three single managers (C-5, mature aircraft, and proven aircraft); three product groups (propulsion, nuclear munitions, and automatic test equipment); four materiel groups (aerospace fuels, aerospace support accessories, ground support equipment, and power systems); and four system support managers (C-17, life support equipment, QF-106 drones, and security systems).

On October 1, 1994, the San Antonio Air Logistics Center gained another product group when the Directorate of Cryptologic Management joined it upon the inactivation of the Air Force Cryptologic Support Center. Each of the integrated weapon system management program managers wrote a concept of operations, identifying the designated acquisition commanders and describing how the various management responsibilities would be handled and who was responsible for them.

Life Support was the first program that went under Integrated Weapon System Management. This took place before AFLC and AFSC merged to form AFMC.

DMR Decisions Continue

In response to persistent calls to cut the Defense Department budget in the summer of 1989, Secretary of Defense Richard Cheney began a process of tremendous change to the traditional ways the military services conducted business. The result was a promulgation of proposals called Defense Management Review Decisions (DMRD). They were designed to reduce costs while maintaining the nation's military strength. Many of these DMRDs dramatically changed the way AFMC and its centers provided logistics support to their customers, leaving managers and workers alike scrambling to understand, implement, and mitigate the changes all at once.

Creation of AFMC itself was the result of one DMRD. Two others altered the financial aspects of center operations. On October 1, 1991, as the center piece of DMRD 971, DOD Financial Systems, the Department of Defense created a single "super fund." Located within this huge umbrella fund, called the Defense Business Operating Fund (DBOF), were those monetary entities that funded repair and supply operations for DOD. Another decision, DMRD 904, Stock Funding of Reparables, decentralized the money AFLC had used to pay for repairs, giving that money to the major commands to manage and control. Four new funding divisions were created and put under the auspices of DBOF: the General Support Division, which paid for consumable items managed by the Defense Logistics Agency (DLA) or the General Service Agency; the Reparable Support Division, which paid for depot repairs; the System Support Division, which the ALCs used to purchase expendable spare parts managed by AFLC; and the Cost of Operations Division, which paid for inventory control point operations, i.e., personnel, utilities, computer equipment and systems, travel, etc.

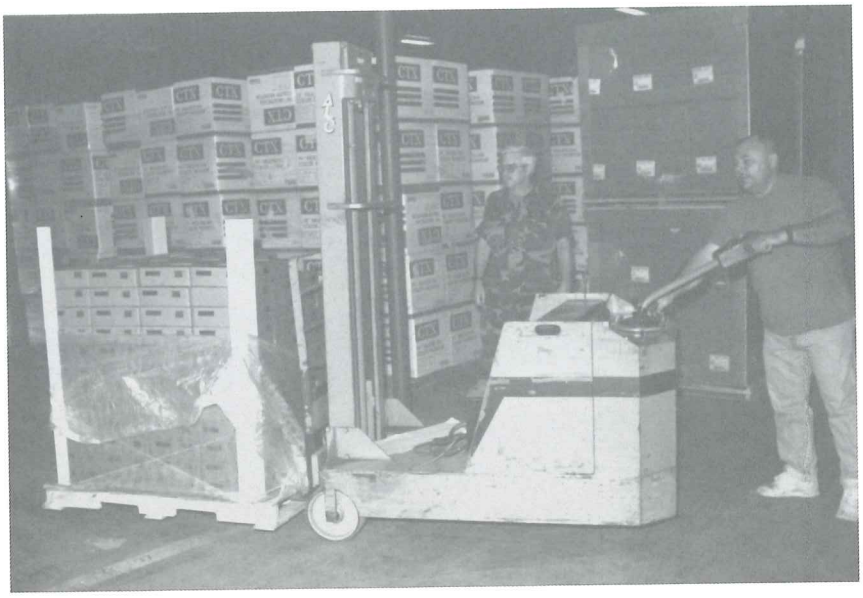

As with any new program of this magnitude, many adjustments had to be made to DBOF. However, continued cuts in the percentage of dollars returned to the ALCs for their work made times very tough. On June 3, 1992, the Office of the Secretary of Defense (OSD) chopped another 11 percent off DBOF for more cost savings. As a result, more than 2,000 San Antonio ALC workers were almost sent home on a 20-day furlough. This no-pay vacation was averted at the last minute, but the future was far from bright.

In the two years following its creation, DBOF achieved neither success nor savings. The AFMC commander, General Robert W. Yates, stated it succinctly when he advised Secretary of the Air Force

Arriving and departing trucks were a common sight at DLA's distribution depot on Kelly AFB.

Sheila Widnall at the end of fiscal year (FY) 1993 that "the speed of implementation and growth has not been supported with viable policy, procedures, or ADP [automated data processing] systems." That was also the verdict of the General Accounting Office (GAO), which observed, "Two years ago, we pointed out that Defense did not have the policies, procedures, and systems in place to operate the Fund. Today, many of the same problems still exist."

In the 1990s, newer and faster computers became ubiquitous across the base.

Defense officials attempted many fixes to correct DBOF's problems. Finally, in December 1996, the Under Secretary of Defense (Comptroller) dissolved DBOF and created four new working capital funds—Army, Navy, Air Force, and Defense-wide. Nevertheless, the new working capital funds exhibited many of the same bookkeeping problems experienced with DBOF, and solutions remained elusive.

One of the more significant changes to ALC operations came about as an attempt to consolidate certain functions and reduce layers of management and command. The intent of DMRD 902, Consolidation of Defense Supply Depots, was to reap significant savings through creation of a single DOD supply system, under the auspices of the Defense Logistics Agency.

On May 16, 1992, DLA took ownership of the majority of Kelly's warehouse space. Actual transfer of the 1,266 civilians and 3 military personnel from the former Directorate of Distribution to the Defense Distribution Depot-San Antonio occurred in July. This ended what had been a fundamental part of operations at Kelly since World War I. A small number of personnel remained on the ALC payroll to support local distribution and transportation activities, first as a part of the Technology and Industrial Support Directorate and, ultimately, as members of the 76th Logistics Group.

Another significant change involved Kelly's communications and computer systems management, one of the fastest growing organizations within the air logistics center due to the enormous changes in computer technology in the late 1980s and early 1990s. Communications became so synonymous with computers that on September 15, 1992, OSD issued DMRD 918, Defense Information Infrastructure. It was designed to break down barriers between the two entities. The purpose of the newly created Defense Information Systems Agency (DISA) was to transform the Defense Communications Agency into an information technology powerhouse. This DMRD went hand-in-hand with DMRD 924, Consolidation of ADP Operations and Design Centers. That DMRD combined AFLC logistics data systems with base level computing systems used Air Force-wide.

First among DISA's regional mega-centers to come on line was the one at Kelly, one of only 16 computer centers, out of an original 50-plus, to survive the consolidation and reorganization. Although initially completed in August 1984, Kelly's computer center had just undergone a renovation and expansion to its raised floor space. It was one of a few in the Air Force that readily adapted to the need for enough space to handle a mainframe capable of processing 7.5 million instructions per second. Between July 1992 and July 1995, Kelly's 1923d Communications Computer Systems Group became a regional processing center, providing base level computing for 14 bases in a 4-state area.

The computer center at Kelly AFB was one of the few in the Air Force that had enough raised floor space to handle DISA mega-center work requirements.

The Defense Information Systems Agency established the Defense Information Technology Services Organization (DITSO) to operate and manage both communications and computing assets in a seamless web of networks and computers, including DOD's mainframe processing centers. On February 11, 1993, DISA and AFMC reached an agreement to transfer part of the redesignated 651st Communications Computer Systems Group from AFMC to DITSO. Ms Suzanne Gorden, formerly the civilian deputy for the group, became the DITSO site manager. Base communications remained under the 651st, but all standard, large scale computer operations and developmental programs currently supporting Air Force standard base level systems and the logistics management systems transferred to DITSO. All personnel transfers were completed by March 12, 1993. The ALC had lost yet another of its missions.

Under DMRD 926, Consolidation of Inventory Control Points, DOD put management of the military services' consumable items in the hands of DLA. The San Antonio ALC was supposed to transfer management for over 115,000 items between FY92 and FY94. However, serious problems with DLA's new information systems delayed the exchange for most of FY92, putting completion of the DMRD seriously behind schedule. Unfortunately, accompanying manpower reductions had already taken place, leaving the center in the unenviable position of still having to perform its management and supply tasks, but with far fewer people. This exacerbated supply problems already inherent with drastically reduced spare parts funding.

Under the auspices of yet another DMRD, the Defense Department sought to save money by

The 76th Computer Squadron continued to provide base communications at Kelly after DISA took over large computer operations.

improving depot capacity utilization, increasing interservicing, and reducing the cost of depot maintenance through competition. Failure to meet the more than $1.7 billion in targeted savings between FY91 and FY95 carried the threat of depot closings throughout the military. Officials at the San Antonio Air Logistics Center identified facilities with 1.4 million square feet that could be "mothballed" or torn down by FY97 to eliminate excess capacity. Initiatives to increase interservicing, that is having one service's depot handle workload previously done by another service's depot, enabled the San Antonio Air Logistics Center to gain some Army gas turbine engine workload and Navy T56 engine overhaul responsibility. However, the greatest change brought about by DMRD 926 was the concept of workload competition.

Sherria A. Dunlap, the Deputy Director of the Aircraft Management Directorate, also served as president of the company the ALC had created for the Speedline competition.

Workload Competition

On June 30, 1990, Deputy Secretary of Defense Donald J. Atwood issued DMRD 908, directing the military, in part, to study and implement public-private competition of its depot maintenance workloads. Pentagon planners handed Air Force Logistics Command a $719.4 million savings target; the San Antonio Air Logistics Center's share came to $138.1 million.

The San Antonio ALC offered its T56 gearbox program, worth an estimated $11.4 million in FY92, for its competition prototype. The choice of the T56 gearbox was an easy one. Officials at Air Force Logistics Command had already directed the center to transfer the workload to the Ogden Air Logistics Center at Hill AFB, Utah. However, by putting the workload up for competition, the San Antonio ALC had a chance to bid on the project and possibly retain it at Kelly. Long experience with the workload, plus facilities already in place, supposedly gave the San Antonio ALC the bidding edge. However, this was the center's first experience at preparing a proposal for a contract, and things did not go as planned. On September 4, 1991, Air Force Logistics Command awarded a one-year, renewable contract for the T56 gearbox overhaul to Standard Aero of Winnipeg, Canada.

Even before the T56 gearbox contract was put up for bid, the center was preparing its entry in the subsequent C-5 Speedline competition. The Speedline program solicited inspection and repair of 71 aircraft (51 C-5As and 20 C-5Bs). It involved three major modifications and four time compliance technical order inspection and repair procedures. Operation Desert Shield/Desert Storm had severely strained the C-5 fleet, and Air Mobility Command wanted it put back in shape. There wasn't time, however, to push the big transports through lengthy programmed depot maintenance (PDM)—8,000 manhours per aircraft for Speedline work versus 40,000 manhours for PDM.

The contract was unique. Not only did the request originate from the C-5 System Program Management Division in the Aircraft Management Directorate at the San Antonio ALC, but members of that directorate served on the proposal team while others sat on the source selection team. Sherria A. Dunlap, the Deputy Director of the Aircraft Management Directorate, served as the "president" of the "Speedline company." A second team included members of the Source Selection Authority, under direction of General Curtis, the ALC commander, with Colonel David Zorich, Director of the Aircraft Management Directorate, as his primary advisor.

Workers performing required tasks of day-to-day maintenance on the C-5s provided information requested from the other two groups and from those agencies that required information necessary to develop bid proposals.

Center contracting officials solicited 22 bids for the C-5 Speedline workload. Only four were returned: Lockheed, Rockwell International, Chrysler Technologies Airborne Systems, and of course, SA-ALC.

On October 8, 1992, Air Force officials awarded the C-5 Speedline contract to the San Antonio Air Logistics Center. The final contract consisted of three one-year options at a total estimated contract price of $34.8 million (versus the original estimate of $70.6 million), saving the government an estimated $35.8 million. The cost savings were directly attributed to availability of facilities, support equipment, and test stands necessary to fulfill the Speedline contract.

However, actual start of Speedline work at Kelly was halting at best. Although the first C-5 was to enter the program in December 1992, current workloads forced planners to delay it until March 15, 1993. Even so, the first aircraft did not arrive until June 15. Although the original schedule had anticipated delivery of 23 aircraft within the first year, only four were actually inducted during FY93.

Once the startup glitches were sorted out, Speedline work rolled along at a quickened pace. One month after the program began, the ALC found itself 10 days ahead of schedule. On September 5, 1993, the first C-5 to pass through Speedline arrived at its home base 25 days ahead of schedule.

In FY93 a problem of international proportion heralded the end of the depot maintenance competition program. The San Antonio Air Logistics Center scheduled two competitions for FY93 worth approximately $50 million: a joint solicitation with

Building 379, the corrosion control facility, could accommodate any aircraft in the Air Force inventory. It used plastic media technology to strip paint from an aircraft's outer surface.

the Navy for the T56 engine and the F100 unified fuel control (UFC). Both solicitations contained restrictions which limited the competitions to sources in the continental United States (CONUS) or Canada.

In January 1993, the Government of Israel, seeking to boost its own aviation industry, questioned the CONUS/North American only restrictions. Air Force officials contended that such restrictions were necessary and in accordance with existing policy.

Initially Air Force Materiel Command cited accessibility in times of crisis as its primary rationale for imposing such restrictions. It later changed the reason to providing additional opportunities for American industry to compete for maintenance workloads. The State Department did not agree with that argument and pushed to open the competition.

However, the Defense Department stood its ground. High-level Pentagon officials suspended the T56 solicitation and put on hold other competitions with similar "North American only" restrictions. Congress even attempted to pass bills blocking the Secretary of Defense from sending defense work overseas if it could be done in the United States or Canada on a cost-effective basis.

Also weighing into the fray was the General Counsel of the Air Force, who issued a legal opinion that said Congress's attempt to help had no effect in law.

In light of responses supporting the decision by the Office of the Secretary of Defense to bar CONUS restrictions, the AFMC commander took the only avenue left open. On April 6, 1994, he directed the San Antonio Air Logistics Center to cancel the UFC and T56 competitions. Kelly workers would continue to repair the F100 UFC along with Air Force and Navy T56 engines. Within a month, the entire depot maintenance competition program was dead.

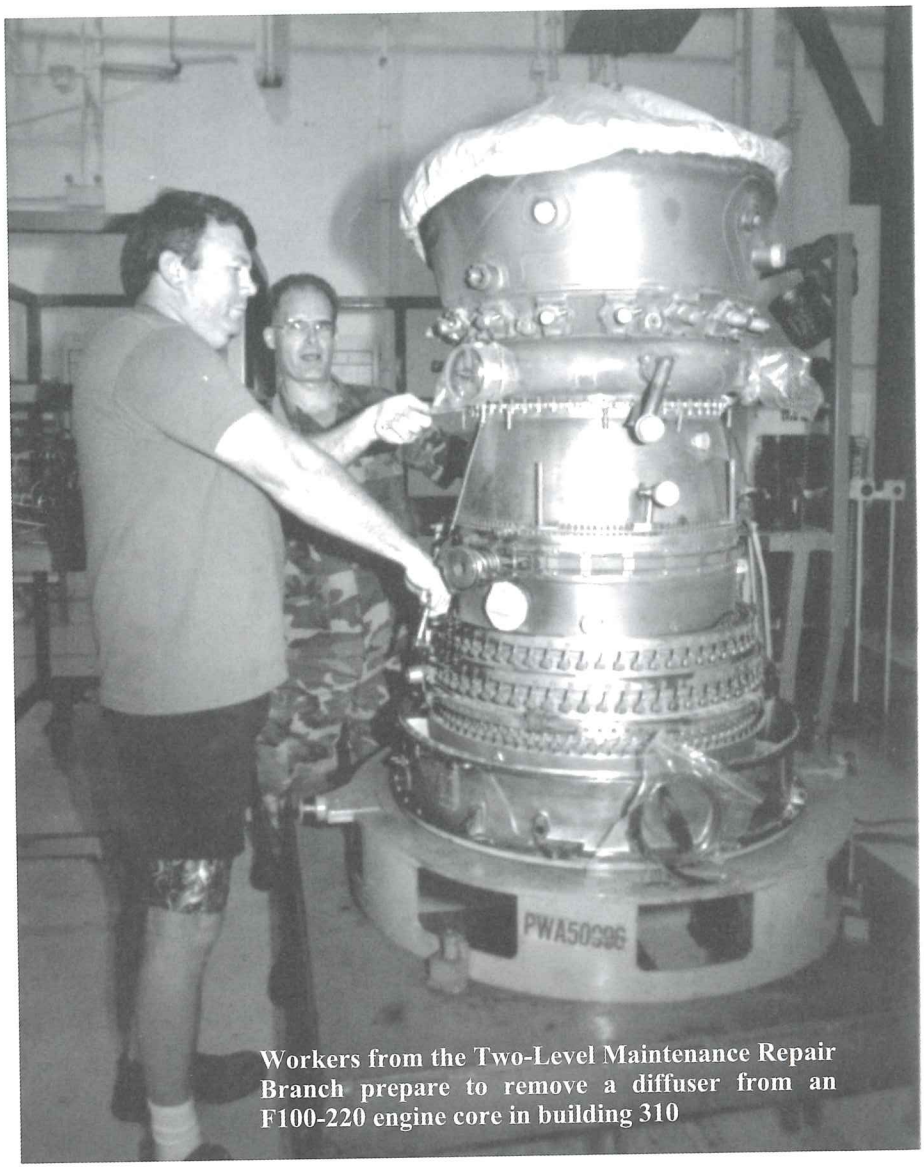

Depots Under Fire

The Department of Defense spent some $15 billion annually on depot maintenance of its various weapon systems, components, and equipment. In light of post-Cold War downsizing and declining budgets, the urge to reduce this amount was intense. At the same time, representatives of defense industries hit hard by lower defense spending lobbied the new Clinton administration to adopt a national policy of satisfying technological and industrial-based needs through the private sector. They pushed for a policy

An employee assembles a gas turbine engine that carried an unconditional 30-day warranty.

that used government facilities to satisfy only the minimum essential war fighting requirements while shifting modifications, upgrades, manufacturing, and depot maintenance work to private industry. Senior defense officials in the Clinton administration seemed to agree. Clearly the issue was a contentious one and not easily resolved, and the push to reduce the defense budget continued, forcing the Air Force to look for other ways to do more with less.

Workers from the Two-Level Maintenance Repair Branch prepare to remove a diffuser from an F100-220 engine core in building 310

Organic Warranty Program

At his first staff meeting on March 30, 1992, Major General Lewis E. Curtis III outlined his top priorities: service to the customer, quality products and services, high productivity, and taking care of the Kelly work force. Now that the Air Force customers had the money, as well as the authority to decide how and where to spend it, General Curtis thought it imperative for the San Antonio Air Logistics Center to exceed its customers' expectations and become their maintainer and supplier of choice. One of the things he wanted the center to initiate was a warranty program.

On October 1, 1992, the warranty program went into effect. Any item overhauled or manufactured at the San Antonio ALC carried an unconditional 30-day warranty. The program proved so successful that, in the fall of 1994, the center extended the warranty period to 60 days. San Antonio became the only air logistics center to guarantee its products.

Two-Level Maintenance

Early in President William J. Clinton's first term, his Secretary of Defense revealed the Pentagon's five-year plan for the nation's defense needs in the post-Soviet Union era: the United States military only needed a force structure that was big enough to fight two regional conflicts at once. For the Air Force, that meant 20 wings. Subsequent reductions would come from the Air Force's infrastructure, and they would be significant.

The concept behind two-level maintenance (2LM) involved reducing the traditional levels of flightline, base, and depot maintenance. Activities formerly handled by the intermediate base-level shops would, in the future, be divided between flightline maintenance organizations and the depots. The goal of this shift was two fold. Air Force officials believed it would be cheaper since civilian labor at the depots cost less than military labor in the intermediate shops. Additionally, senior personnel argued that elimination of the base shops would reduce substantially the logistics "tail" which normally accompanied a flying organization upon deployment, a fact graphically illustrated by Operation Desert Shield/ Desert Storm.

Military and civilian personnel worked side-by-side on T56 engines as two-level maintenance ramped up to full production.

When senior Air Force leaders decided to shift to two-level maintenance in June 1992, they directed it be implemented in only three months. Trauma both in the field and at the depots ensued. Initially, two-level maintenance involved engines and avionics only, with the emphasis on engines at the San Antonio Air Logistics Center. Workers at the ALC began with the F100-220 in 1993 and expanded to the TF39 and T56 in 1994. However, the move included far more than just shipping engines to Kelly. Cost data had to be gathered, schedules adopted, transportation arranged, support equipment assembled, and a whole new work force and work area put in place.

In theory, engines arriving under two-level maintenance would require far less maintenance than those sent in for complete overhaul. It would require fewer manhours, or so planners thought. In reality, most engines that arrived were "the worst of the worst." Many had been cannibalized for good parts and stuffed with inoperable replacements so that stocks of working items could be maintained in the field. The 2LM engines more closely resembled those destined for total overhaul.

The whole idea around two-level maintenance was quick turnaround. But that hope soon dimmed. The pipeline that war fighters feared would lengthen and clog soon suffered recurring blockage. In the early days of two-level maintenance, mechanics in the field held non-working engines to cannibalize parts, and transportation arrangements were sometimes inadequate. Parts, tools, workers, and workspace were often unavailable on the Kelly end of the pipeline.

It was not long before major steps were taken to correct initial deficiencies in the 2LM process. Veterans of two-level maintenance teamed with less experienced personnel to help lower the learning curve. Managers developed long-range scheduling tools and initiated orders and schedules as soon as they learned an engine was inbound. Creation of forward supply centers at the repair locations cut trips across the base for parts. Center officials invested money to upgrade facilities. Unfortunately, two-level maintenance continued to suffer the same problem that affected depot engine overhaul–funding shortfalls.

By the beginning of FY96, two-level maintenance supported 22 percent of the F100-220 fleet, 35 percent of the T56 fleet, and 90 percent of the TF39 fleet.

Then, on February 1, 1996, the commanders of Air Force Materiel Command and Air Combat Command decided that the F100 modular engine design was better served under the old three-level maintenance concept. Lower than expected 2LM savings due to technical surprises, cannibalization, and the inability to use the full time remaining on most engine modules adversely affected readiness. However, 2LM work on TF39 and T56 engines continued at Kelly.

Lean Logistics

Lean Logistics was another effort that had to come to grips with the realities of the 1990s. Greatly reduced resources, manpower reductions, and base closures and consolidations all had serious affects on the way the Air Force operated. The RAND Corporation, a private "think tank" hired by the Air Force to improve logistics practices, conducted a study that guided the program's efforts in early 1993.

Previously, the Air Force stockpiled millions of items just in case. One of the core proposals of the RAND study included replacing "just in case" logistics with "just in time." The study claimed significant cost savings and improvements were possible by shortening repair throughput times, adapting to changing production and repair requirements rapidly, delivering door-to-door, and speeding up procurement and administrative lead times. Lean Logistics put users in partnership with AFMC, contributing to decisions that affected their weapon systems.

The San Antonio ALC entered the Lean Logistics arena with much enthusiasm. The C-5 became the first weapon system involved in the Lean Logistics demonstration early in FY94. Center and AMC managers selected 33 parts used on the C-5, some critical, all high usage. The idea was to speed orders for these particular parts, get the items into and back out of the repair process as soon as possible, and back to the user in record time.

Nevertheless, the progress of Lean Logistics was sporadic across the command until 1996. In February of that year, General Henry Viccellio, Jr., AFMC commander, presented his vision of the Air Force's future logistics system at the Senior Leaders' Materiel Course. It included a wide range of topics from a model for new standard processes and a support suite of information systems to an overall plan to manage, integrate, and implement an operational, end-to-end demonstration of Lean Logistics concepts called Pacer Lean. Central to General Viccellio's vision were the Depot Repair

Over a 36-year period, almost 1,500 B-52s passed through the PDM process at Kelly AFB.

Enhancement Program (DREP) and the Contract Repair Enhancement Program (CREP).

Ten prototype shops (two per ALC) started operating under Pacer Lean tenets to test concepts and incorporate any newfound opportunities for improvement. Two shops within the Aerospace Equipment Management Directorate were San Antonio ALC prototypes. The Exciter shop in building 308 began using the new methods on July 22, 1996, while the Secondary Power System shop in buildings 329 and 331 went "lean" on September 3. Although not without problems, implementation in the Exciter shop produced good results. The number of mission capable (MICAP) incidents and hours continued to fall. Pacer Lean implementation in the Secondary Power Systems shop was more of a challenge, however, because of a larger number of items being repaired and longer repair flow times.

With 10 prototypes operating across the command at the end of FY96, attention turned to full deployment of DREP for the rest of the commodities. During a March 14, 1997 video teleconference, General Viccellio agreed with his staff's recommendation to proceed with full DREP deployment at a measured pace, following the ALCs' plans. Although the rest of the command participated fully in DREP by December 1997, the San Antonio ALC was not a major player. Due to impending closure, the number of Pacer Lean shops at Kelly began to decline as workload transferred.

On February 8, 1998, the center disbanded the Financial Management Directorate's Lean Logistics Division. It was felt that the San Antonio ALC had completed its Lean Logistics evolution. The program demonstrated its logistics flexibility during peacetime conditions by evaluating and responding to worldwide conditions on a daily basis. During the NATO [North Atlantic Treaty Organization] bombing campaign against the former Yugoslavia in 1999, Lean Logistics precepts proved successful in adjusting to surge conditions. The test that began in 1993 had indeed spawned a new way of doing business.

Reengineering

At the beginning of the summer of 1994, Air Force Materiel Command was hit by more manpower reductions. On June 2, the Under Secretary of Defense for Personnel and Readiness directed DOD organizations to accelerate and expand previously programmed civilian reductions to implement the cuts mandated by Vice President Albert Gore's National Performance Review. As a result, the air logistics centers would lose a total of 3,547 positions by the end of 2001. In light of the massive reductions planned, AFMC decided it had to reengineer, that is fundamentally change how the command conducted business.

As SA-ALC officials worked their way through a variety of ideas for reengineering, General Curtis decided to establish a dedicated group for the effort. On August 3, 1994, the Directorate of Reengineering opened. Additionally, AFMC formed an executive director-level steering group to look at its major inventory and maintenance management business practices. Each air logistics center assumed responsibility to reengineer a specific task—San Antonio's was the stock control and distribution area.

San Antonio's reengineering group selected two activities to examine: material support in C-5 maintenance and F100 overhaul. In August 1995, the team finished its evaluation, and the reengineering effort moved into the implementation stage, enabling the Reengineering Directorate to disband. San Antonio's support to the command effort, however, continued.

Restructuring

In 1994 with direction from Air Force Materiel Command to implement integrated product development across the command, General Curtis acted on his long-standing wish to reorganize the Aircraft Management Directorate. Three of the ALC's single managers (C-5, Tactical/Trainer, and Proven Aircraft System Program Management Divisions) resided in the one directorate, all vying for the necessary resources and production capabilities found in the other two divisions over which they exercised no authority. Clearly, this situation ran counter to AFMC's concept of empowering the single manager with all the authority and resources necessary to run his program.

General Curtis wanted to create flexible, agile, manageable business units with a clear customer focus even though that involved major changes in the corporate structure of the air logistics center. His goal was to align both maintenance and management of a given system in the same organization, believing maintenance became more effective and efficient as part of a single organization instead of being viewed as a subcontractor to the single manager.

With Air Force-wide emphasis on strategic airlift, General Curtis knew that the smart thing to do was to establish a C-5 directorate and give it control over its resource management and production functions. He also believed it made sense to create a C-17 directorate to put the sustainment activity of the new airlifter on the same organizational level as its older counterpart.

That left the Tactical/Trainer and Proven Aircraft System Program Management Divisions. He decided to combine them into one directorate to take advantage of the synergism the two units could provide each other. The T-38 Branch from the Aircraft Production Division would move under the Mature Aircraft (Fighter/Trainer) Directorate as well, giving its single manager authority over his production workers for the first time. Out from under the huge shadow of the C-5, the T-38 production line would receive the undivided attention it needed. The three new directorates went into operation on May 1, 1994. The T-38 Production Branch became a part of the Mature Aircraft Directorate on June 6.

The general now had the accountability he wanted. He obtained multiple weapon system points of view from responsible single managers. They brought both program management and production aspects into the corporate discussions, increasing the commander's exposure to what was happening to the variety of weapon systems and products managed at the air logistics center.

On August 31, 1994, the San Antonio Air Logistics Center ended a 32-year relationship with the 896th Munitions Squadron at Nellis AFB, Nevada, and the 898th Munitions Squadron at Kirtland AFB, New Mexico. These were the only remaining units that originally were established as aviation depot squadrons in the '50s and '60s. The two squadrons realigned under the 377th Air Base Wing at Kirtland under the Air Force Chief of Staff's "one base, one boss" philosophy.

In April 1994, General Yates decided that the air base groups at the five air logistics centers and the

UNIT REORGANIZATION

It wasn't just the SA-ALC directorates that experienced massive organizational change in the early 1990s. Kelly's military units went under wholesale reorganization during this time as well. Since August 1, 1953, Kelly's host unit had been the 2851st—first as an air base wing and after October 16, 1964, as an air base group. As part of Air Force Chief of Staff General Merrill A. McPeak's Year of Organization in 1991, this all changed. Faced with Air Force-wide restructuring and downsizing, General McPeak wanted to save the Air Force's most historic units; consequently, he did away with four-digit, major command controlled units, replacing them with Air Force controlled two-and-three-digit designations. Kelly's 2851st Air Base Group was inactivated and replaced with the 651st Support Group on October 1, 1992. Like the rest of the Air Force, AFMC was trying for organizational consistency as it lined its military units under an objective center structure. Other units like the 2851st Security Police Squadron, 2954th Combat Logistics Support Squadron, and the 1923d Communications-Computer Systems Group also picked up the 651st designation. Other changes occurred simultaneously as the USAF Clinic Kelly became the 651st Medical Squadron, the 2873d Test Squadron became the 313th Test Squadron (later Flight Test Squadron), and the 3096th and 3098th Aviation Depot Squadrons became the 896th and 898th Aviation Depot Squadrons, respectively.

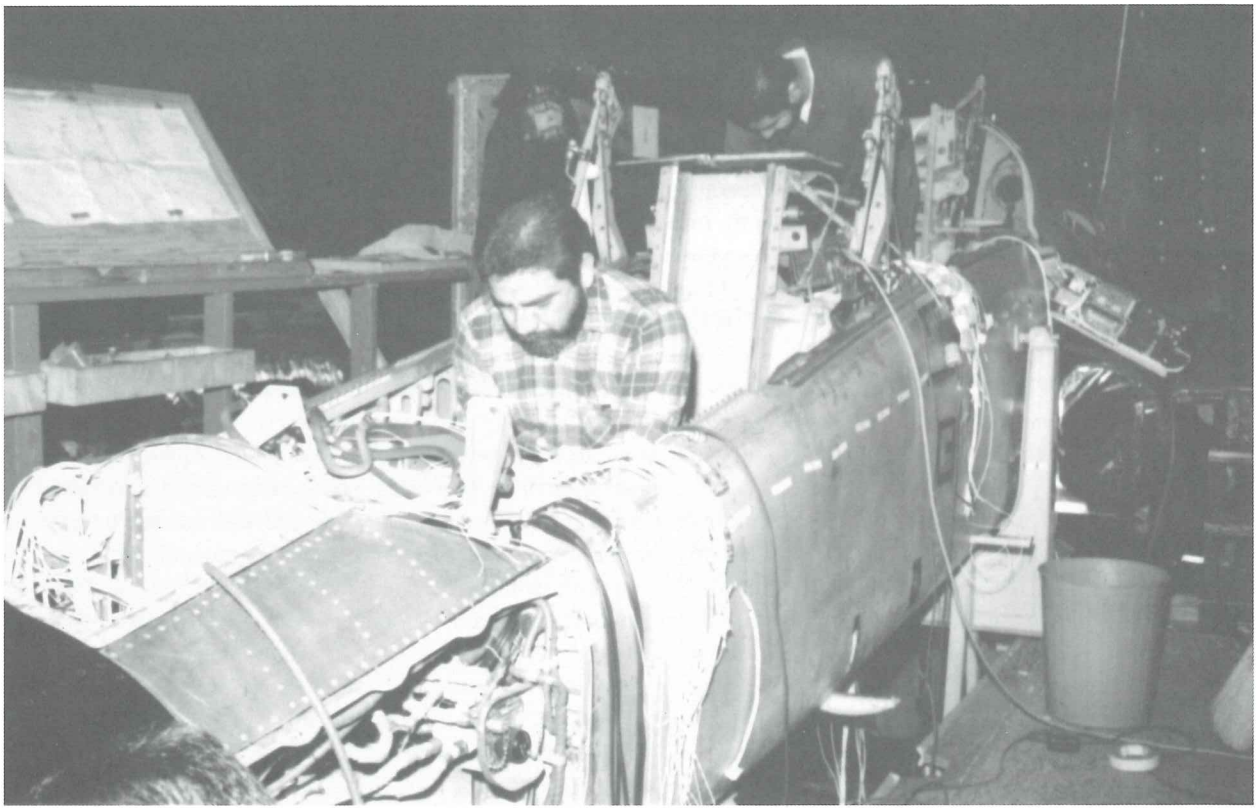

But change didn't stop there. One year later, on October 1, 1993, HQ USAF redesignated the support group as the 651st Air Base Group. The command also activated the 651st Operations Support Squadron and inactivated Detachment 40, 651st Support Group, replacing it with the 651st Munitions Squadron. This was followed by a command-wide reorganization the next year as AFMC lined its host base units under the objective wing structure. On October 1, 1994, the 76th Air Base Wing replaced the 651st Air Base Group. Colonel James P. Concannon was Kelly's first host unit wing commander in 30 years. Under the wing were the 76th Civil Engineer Group, the 76th Medical Group, the 76th Logistics Group (with the 76th Munitions Squadron), and the 76th Support Group (with the 76th Security Police Squadron, 76th Mission Support Squadron, and 76th Communications Squadron).

Electronic Security Center at Hanscom AFB, Massachusetts, would change to wings. Six months of fevered planning ensued. On October 1, 1994, the Kelly ALC replaced its 651st Air Base Group with the 76th Air Base Wing.

The challenges of restructuring included coming to grips with the enormous diversity of the different functions moving into the wing and finding the authorizations, both military and civilian, within existing resources for the new groups and squadrons. Nevertheless, the new air base wing commander expected Team Kelly would be better served by the new organization.

PDM process during Desert Shield/Desert Storm receive top priority. However, B-52H aircraft belonging to Air Combat Command were still sharing ramp and hangar space at Kelly with the Galaxies. The Oklahoma City ALC, which held B-52 system program director responsibilities, reclaimed source of repair functions for the dwindling B-52G inventory the year before in order to bring down its excess capacity, a term that would play a major role in upcoming base realignment and closure decisions.

As early as December 1991, Major General Joseph Spiers, the Oklahoma City ALC commander, questioned Kelly's ability to meet B-52H PDM

A machinist from the Technology and Industrial Support Directorate checks the position of a T-38 longeron splice on a milling machine that carves the part out of an aluminum block.

Aircraft Issues

Kelly Bids Farewell to the "Buffs"

By FY92 a delicate balancing act was under way involving B-52 programmed depot maintenance at the San Antonio Air Logistics Center. Air Mobility Command was insisting that C-5s withheld from the deadlines. He based his doubts on FY91 performance data which showed late delivery of 14 out of 15 bombers that year. Major General Richard D. Smith, Spiers' counterpart at the San Antonio ALC, assured the Oklahoma City ALC commander that "get well" plans were on the board to ensure on-time delivery resumed by May 1992. However, a decision made by President George Bush intervened. Bush proposed

retiring all B-52G aircraft, leaving only 29 H models on active duty by FY95. The die was cast.

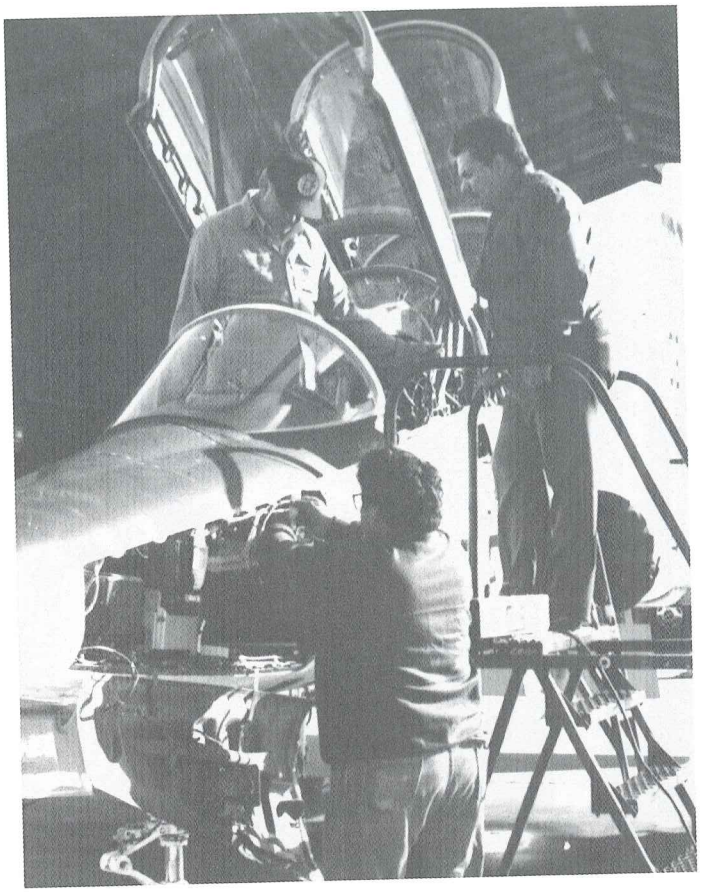

On April 21, 1993, General Yates spoke to workers who had gathered to bid farewell to the last B-52 to pass through the PDM process at Kelly. He praised workers for their support of a weapon system that had served the country well—from the Cuban missile crisis of 1962 to Operation Desert Storm in 1991. As the "Stratofortress," tail number 60-012, raised off the Kelly runway, it went into a circular pattern and made a low-level run above the cheering crowd. A long relationship had come to an end. Over the preceding 36 years, 1,427 B-52s had passed through the PDM process at Kelly. It was the longest association between the work force and aircraft in the center's history to date.

The Durable "Tweet" and "Talon"

Two of the most durable aircraft in the Air Force inventory turned out to be those used to train fledgling fliers—the T-37 "Tweet" and the T-38 "Talon." For nearly 20 years, Air Force officials had studied replacements for the T-37 and T-38. Yet it always came back to the same decision—fix them, upgrade them, and keep them flying. It took exceptional effort by those at the Kelly air logistics center who managed these weapon systems to extend the lives of these aircraft well beyond original expectations.

The air logistics center managed various modification programs for both of these aircraft over the years, most notably on the T-38. However, most of the major upgrades were done under contract by Lear Siegler Management Services Corporation at its Queen Bee facility at nearby Randolph AFB or by company field teams.

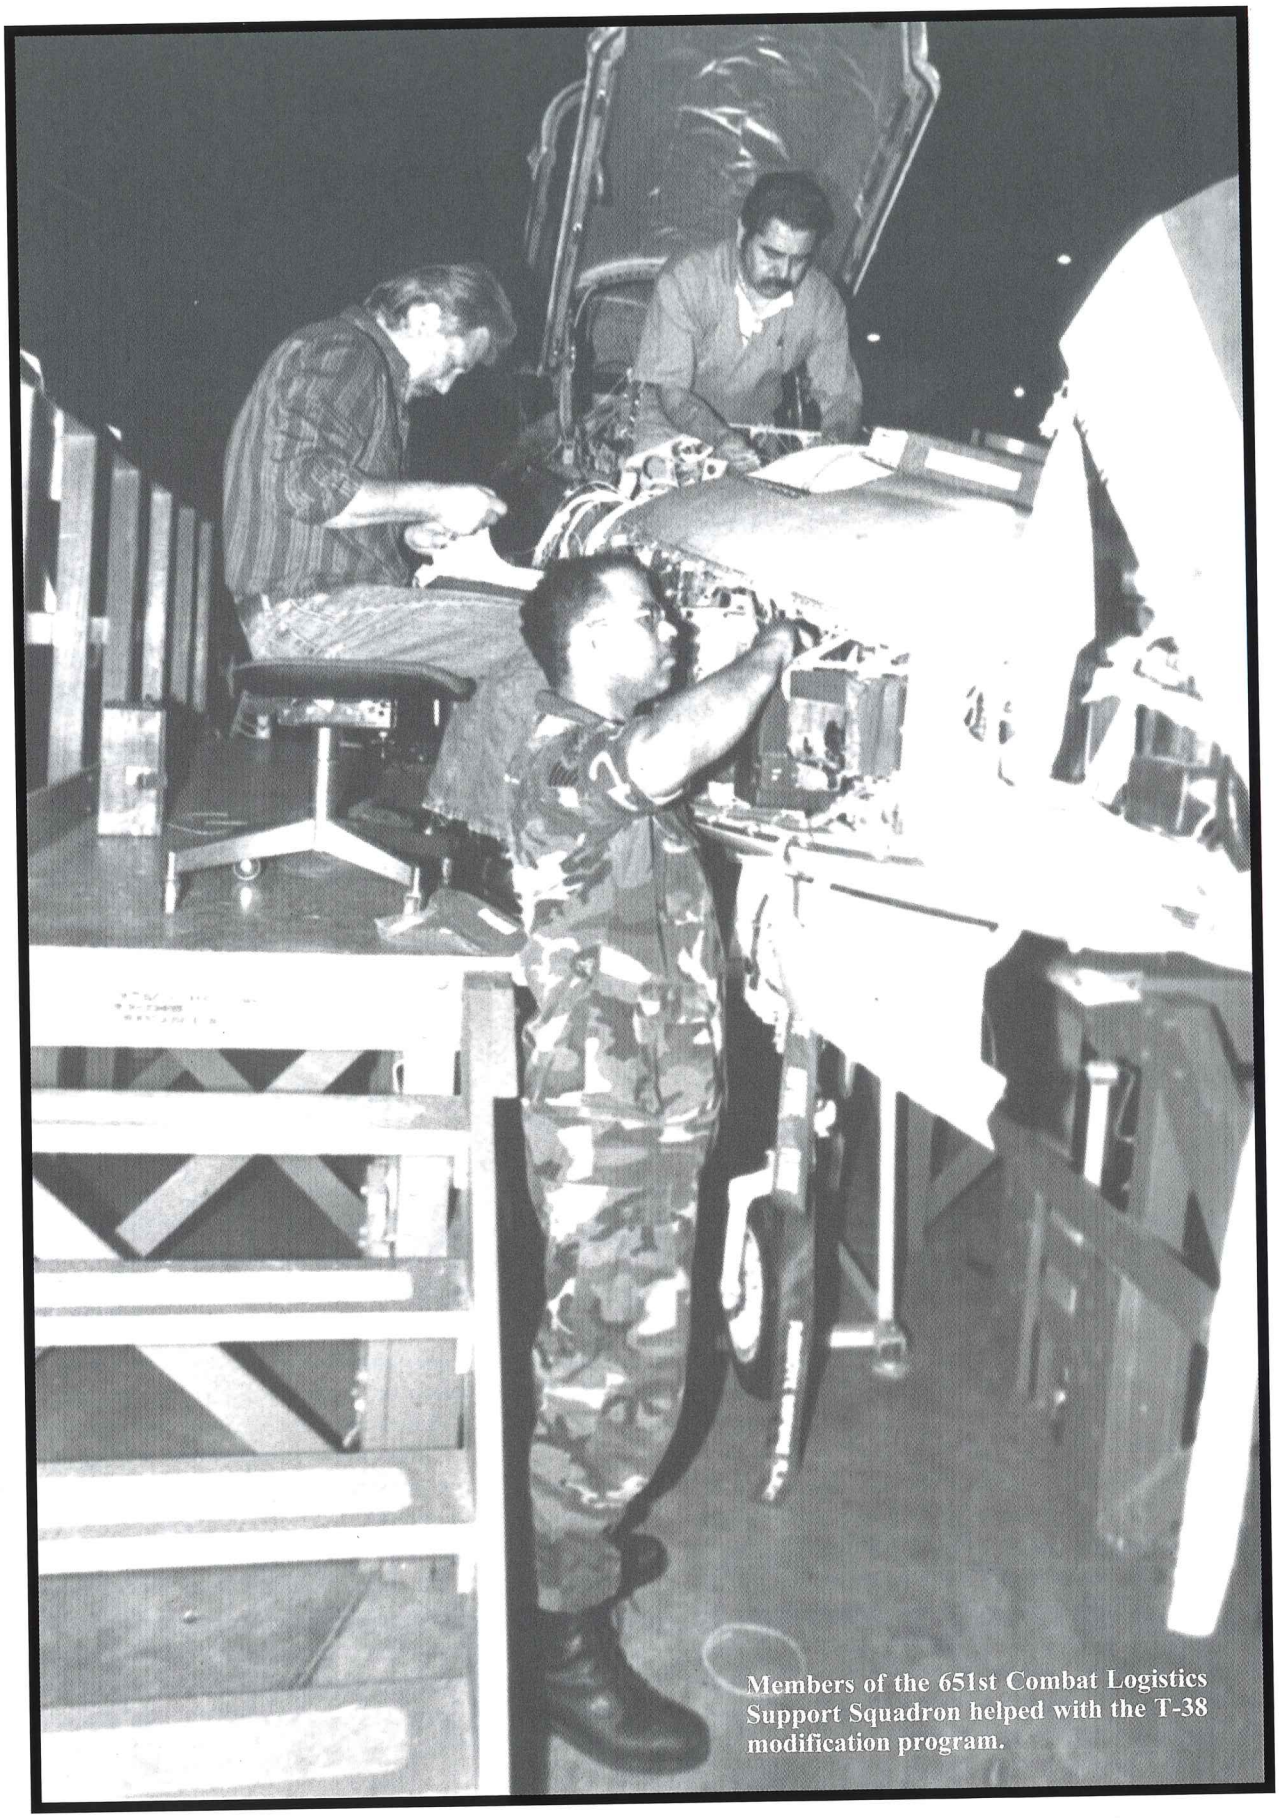

Primary to the Tweet's rejuvenation was the Structural Life Extension Program, or SLEP. Periodic funding lapses and some indecision as to whether the aging T-37 would remain in the Air Force inventory past the year 2000 caused SA-ALC managers sometimes to refer to the effort as "SLIP." However, the massive modification program was finally completed in May 1994. Over the four-year life of SLEP, T-37 system program managers oversaw modifications to horizontal stabilizers, fuselage assemblies and fittings, and wing support straps on 538 Tweets at a cost of $56 million.

On March 13, 1992, personnel at Kelly begin work on the T-38 cockpit modification program.

"Talon" Gets New Lease on Life

By 1992 SA-ALC officials had seen the writing on the wall regarding what critics in Washington termed "excess facility capacity." Major General Smith, the ALC commander, actively pursued additional workloads to fill the void created by departure of the B-52. What seemed like manna from heaven appeared in the form of an offer from Air Training Command (renamed Air Education and Training Command on July 1, 1993). The ATC commander, Lieutenant General Joseph W. Ashy, was anxious to clear ramp space at Randolph AFB to accommodate a proposed T-43 workload from Mather AFB, California, which was closing. The Lear Siegler Queen Bee contract field team operation at Randolph monopolized most of that base's south ramp area with T-38s awaiting modifications. What better place to perform the needed modifications than Kelly? Great facilities and work force. It turned out to be a fateful decision.

Members of the 651st Combat Logistics Support Squadron helped with the T-38 modification program.

On March 13, 1992, a T-38 landed at Kelly AFB, heralding the San Antonio Air Logistics Center's first step into the T-38 cockpit enclosure modification (CEM) business. The aircraft, used for advanced pilot training since 1961, were showing their age. Modification and repair had become an almost constant process during its third decade of use. The Aircraft Production Division was handed numerous tasks, including modification of the cockpit enclosure and rewiring of the entire aircraft. Mechanics, some of whom had worked on the B-52 since they first came to Kelly, were assigned to the sleek, little jet trainer.

Problems with the T-38 workload at Kelly began almost immediately. Funding shortfalls delayed cockpit modification efforts, even though Air Education and Training Command was losing pilots and planes due to catastrophic bird strikes, a problem newly strengthened cockpit canopies were designed to prevent. In addition, a lack of training for former B-52 workers also proved to be a "show-stopper."

Although Kelly workers performed quality sheet metal work on large aircraft, the switch to the small T-38 proved troublesome. Following the transition from bomber to trainer aircraft in late FY93, workers had gone through weapon system familiarization training, but no courses were instituted to bring sheet metal workers up to the more highly skilled mechanic level required for the Talon. Similar problems plagued the T-38 rewiring effort.

One of the most bothersome and potentially catastrophic problems revolved around little things in the cockpit that didn't belong there. The problem with foreign objects became so serious that AETC officials threatened to cancel their contract with Kelly. Drastic measures were needed to salvage the workload. So, T-38 production officials closed the production line for four months. This time was used to train production and quality assurance personnel in the more precise art of fixing small aircraft. Directorate leaders formed a Sheet Metal Work Center Team to study the problem and come up with solutions. With the help of just about everyone on the production floor, the team developed numerous hand-crafted tools to deal with cockpit modification requirements. In addition, the team produced better blueprints and work control documents. Improved vacuum system techniques were developed along with foam blocks and curtains designed to keep small objects from falling into inaccessible cockpit nooks and crannies. Altogether, 52 changes were made to the CEM process.

A similar team tackled wiring harness problems–wiring too short or too long, improper connections, broken wires, etc. These wiring harnesses, which prisoners in the federal prison system built, also plagued Lear Siegler, Kelly's competition in the T-38 modification program. The Kelly solution involved 100 percent inspection and testing of wiring harnesses prior to installation.

When T-38 production began again, after being given a "second chance" by the AETC commander, local quality control specialists and a team of AFMC inspectors were staring over the shoulders of the workers. Ultimately, inspections were reduced, and aircraft came out "clean." By the end of FY94, hourly production labor rates had fallen by 75 percent. Further improvements were made in FY95 to the point that T-38s modified and repaired at the San Antonio Air Logistics Center went back to their home bases with warranties that guaranteed material and workmanship for one year. Personal contacts were intensified between T-38 production managers and customers. Assurances were offered that Talons would arrive at their home bases on time and in tip-top condition.

On January 22, 1996, the final T-38 to undergo cockpit modification and rewiring at Kelly left on its way home to Whiteman AFB, Missouri. It was the last of 82 Talons repaired by San Antonio ALC workers since the program began in March 1992. The record testified to a systematic turnaround in what began as a troubled program. Defects were reduced by 80 percent. More than half the aircraft were delivered with zero defects. Man-hour labor and production costs dropped from $150 per man-hour to $40. It was rework (an aircraft returned to Kelly because it wasn't fixed right the first time) that pushed the price so high in the beginning. That ceased.

The T-38 workload shifted back to Lear Siegler's Queen Bee facility at Randolph AFB. Those Kelly workers involved in the four-year project were reassigned to support C-5 engine or technology and industrial support workloads.

With the quantum leap in avionics aboard modern fighter aircraft, such as the F-15, F-16, F-117A, and B-2, it became vital for the T-38 to upgrade its own avionics packages to allow student pilots more rapid transition to their post-graduate roles. On July 31, 1996, the Air Force awarded the contracts for the T-38 avionics upgrade to McDonnell Douglas.

Shortly thereafter, Boeing purchased McDonnell Douglas, and the T-38 Avionics Upgrade Program became Boeing's "baby." The San Antonio Air Logistics Center retained management of the upgrade under the long-established Pacer Classic program with help from the Aeronautical Systems Center's Training Management Area Group at Wright-Patterson AFB in Ohio. Approximately 460 of the trainers were to be upgraded to the T-38C configuration by FY04.

Finally in 1981, Aeronautical Systems Division (ASD) selected the proposal submitted by Douglas Aircraft Corporation of Long Beach, California. The new wide-bodied, long-range, short takeoff and landing transport was dubbed the C-17.

Throughout RFP [request for proposal] preparation and negotiation, the San Antonio Air Logistics Center cast a coveting eye toward the C-17. Basing their argument on management and

Air Force Logistics Command awarded system management responsibility for the Air Force's newest cargo transport--the C-17--to the San Antonio Air Logistics Center in June 1982.

Globemaster III—Fitting in Between

As the C-5A began to roll off Lockheed Georgia assembly lines in increasing numbers in the mid-1970s, Air Force planners perceived a gap between strategic and tactical airlift. The Galaxy could haul large loads long distances and deposit them at bases with long, wide runways. It was usually the C-130 that carried cargo and troops to short, unimproved airfields in forward areas. What the Air Force wanted was something encompassing both of these capabilities—an aircraft that could carry oversized loads over long distances at maximum speeds to the virtual end of the supply pipeline.

maintenance experience with the larger C-5, center officials made a strong case. In June 1982, Air Force Logistics Command awarded C-17 system management responsibility to Kelly. The following month, ASD signed contracts with Douglas for the purchase of 210 of the new transports, along with 966 Pratt & Whitney F117 engines, all for a total cost of $34.5 billion.

In August 1988, SA-ALC engineers assumed a presence at the Long Beach factory just as Douglas workers began assembly of the first C-17. Decisions regarding engineering support, spares provisioning, inventory management, site activation, and depot maintenance were already being studied and acted

upon. Primary among these efforts was getting Charleston AFB, South Carolina, ready to receive its first fledgling Globemaster III, the name the Air Force gave its new transport. The C-17 flew for the first time on September 15, 1991.

With the merger of Air Force Logistics Command and Air Force Systems Command in July 1992, AFMC was charging full tilt into the Integrated Weapon System Management arena. Problems turned out to be too big for "a single point of contact." The new command set up System Program Office (SPO) North (Aerospace Systems Center, Wright-Patterson AFB) and SPO Southwest (Kelly). Once the concept of operations was finalized in August 1993, the two SPOs merged, and the organization at Kelly fell under the one at Wright-Patterson.

By early FY93, some had begun to doubt the survivability of the C-17, even before the first models completed testing. Congress was becoming cranky concerning cost overruns, wing weakness, along with range and payload shortfalls. In addition, stress tests showed weakness in both wings at 128 percent of load, when they were supposed to stand up to the 150 percent mark. If the Air Force were going to pay $170 million per airplane, Congress and the Pentagon wanted to make sure the wings did not fall off.

During the furious uproar, local C-17 personnel could do nothing more than carry on, marking time even as the first four aircraft entered the inventory. As a result of a Defense Science Board evaluation, the Air Force stopped spending on the program and began negotiations with McDonnell Douglas to resolve outstanding issues. Congress took an ax to the C-17 program, only agreeing to fund the purchase of 40 new aircraft, a far cry from the 210 originally envisioned.

Although the object of Integrated Weapon System Management was to provide a central point of contact for customers, the C-17 effort remained divided with the Aeronautical Systems Center acting as SPO and the C-17 Management Directorate at Kelly handling support system manager responsibilities. Although they were separated by nearly 1,000 miles, they remained in daily contact through a dedicated video

This is a view of the cockpit of the C-17.

teleconferencing hookup. In early 1993, this communications lifeline proved a vital link when the most intensive field testing ever conducted on a new transport aircraft decided the future of the C-17.

On April 30, 1993, the Department of Defense ordered a special Defense Acquisition Board convened to review the C-17 program. It was to concentrate on the aircraft's system requirements, operational effectiveness, and system affordability. Then, in December of the same year, the Pentagon added a Depot Cost Benefit Analysis to determine whether the C-17 should be repaired and maintained organically by contractor or a combination of the two. Decisions based on these two studies were slated for 1995. That was also the time the Air Force would decide whether to purchase more than the initial buy of 40 C-17s.

The C-17 directorate at the San Antonio ALC was extremely busy throughout 1994 supporting studies and tests to see if the Air Force would receive 40, 80, or 120 new airlifters, numbers that were still hotly debated. Flight and ground-loading tests began at Edwards AFB, California, in May. In June the Globemaster III set its twenty-second world record, this one for short takeoff and landing aircraft. It carried 354,736 pounds to an altitude of 2,000 meters, with takeoff and landing performed on a runway of less than 1,500 feet. Aircraft P-3 (the "P" stood for production) then went to Laguna Army Airfield near Yuma, Arizona, for hot weather testing, where it excelled in temperatures averaging 118 degrees.

In October 1994, real world events took over. Saddam Hussein, still pugnacious even in the face of his Desert Storm defeat three years earlier, began a troop buildup near the Kuwaiti border—again! The United States responded with Operation Vigilant Warrior, a massive buildup of its own. Two C-17s participated and moved 16,000 tons of cargo, including a 5-ton mobile command post, two M934 expanded communications vans, an M105 trailer, and additional support equipment. The Globemasters flew 17.2 hours, nonstop to the Persian Gulf, the longest flight to date for the C-17.

Praise began to replace criticism as test results were made public. One particularly important "pat on the back" came from the Air Force Association (AFA) in the form of the 1994 Collier Trophy for "the greatest achievement in aeronautics or astronautics in America, the value of which has been demonstrated by actual use in the previous year." The association commended McDonnell Douglas, its team of subcontractors and suppliers, and the Air Force for "designing, developing, testing, producing and placing into service the C-17 Globemaster III, whose performance and efficiency made it the most versatile airlift aircraft in aviation history." The C-17 workers at the San Antonio ALC also received recognition for their contribution to the success of the 1994 tests. They cheered the news and went back to work.

The C-17 flew its first operational mission to Southwest Asia to counter Saddam Hussein's second build up of forces on the Iraqi-Kuwaiti border in October 1998.

The C-17 first landed at Kelly AFB on October 14, 1994.

Employees at the San Antonio Air Logistics Center had labored on the C-17 program, working at various levels, for more than 15 years. However, they did not get a chance to see the results up close until October 14, 1994, when a Globemaster III touched down on the Kelly runway for the first time. Nearly the entire Kelly work force turned out, and the crew could not help but show off one of the unique capabilities of the new aircraft. The C-17 intentionally overshot its designated parking spot by several yards, stopped, and then backed up! Previously, only the much smaller, turboprop-driven C-130 was able to taxi in reverse.

In an effort to quiet any remaining criticism, iron out any residual "bugs," and prove the worth of its new aircraft, the Air Force conducted a massive Reliability, Maintainability, and Availability Evaluation in the summer of 1995. The evaluation tested the C-17's operational capability and support crew processes used during peacetime, contingency surges, and wartime sustainment.

As part of the evaluation, members of the 437th and 415th Airlift Wings from Charleston AFB deployed to Barstow-Daggett Airfield in California's Mojave Desert. Using 12 aircraft divided into two segments, C-17s and their crews were pushed to the limit. Everyone was watching—McDonnell Douglas; the System Program Office; the Air Force Operational Test and Evaluation Center at Kirtland AFB, New Mexico; congressional watchdogs from the General Accounting Office; and, of course, several representatives from the San Antonio Air Logistics Center.

Much of the C-17 effort at the San Antonio Air Logistics Center was directed toward bed down and support at Charleston AFB; Altus AFB, Oklahoma; and future home bases. "Sustainment" was the key, and evolution brought about the term "flexible sustainment." However, because of early fluctuating support for a full fleet of C-17s, planners found it difficult to determine whether maintenance on engines and airframes should be performed organically (by an air logistics center) or by commercial contractors. Base Realignment and Closure (BRAC) Commission decisions in 1993 and 1995, plus recurring debate over the "60/40" rule limiting how much maintenance work could be contracted, forced future support planning into a "flexible" mode.

This photo shows a C-17 in flight.

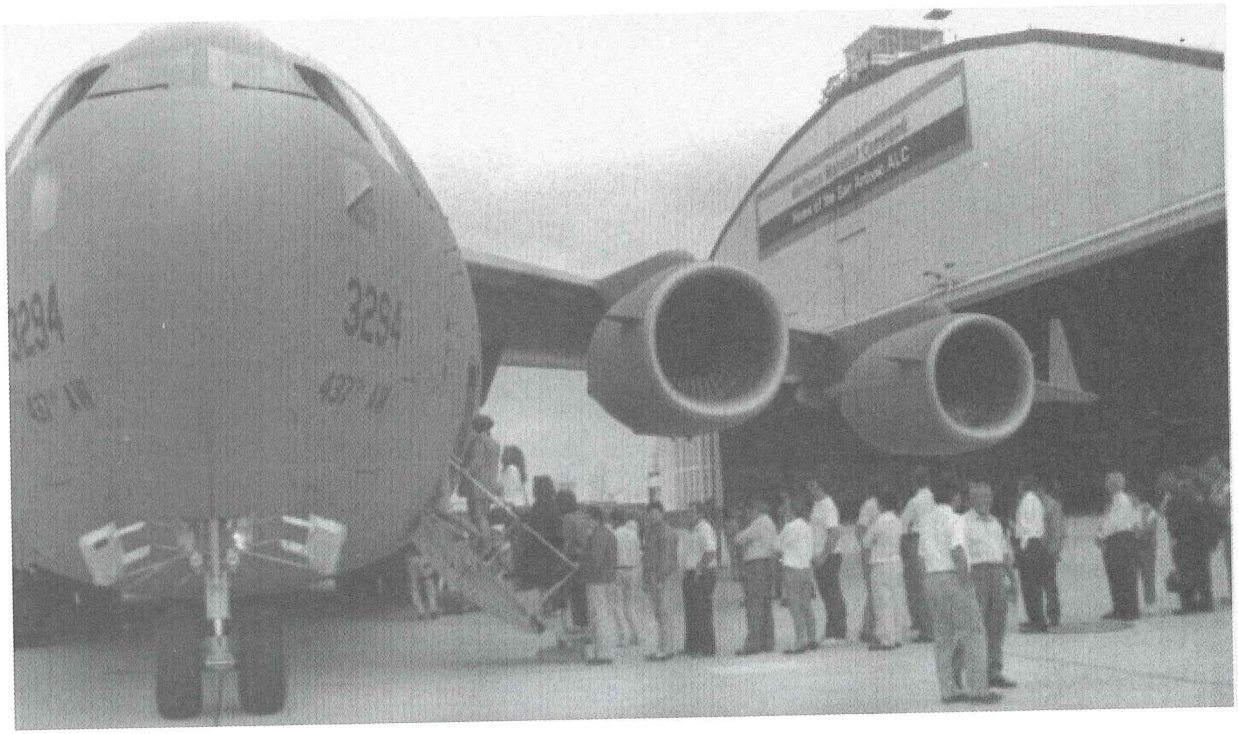

A General Officer Steering Group, made up of senior leaders from throughout Air Force Materiel Command, finally settled on Flexible Sustainment (a term coined to indicate contractor support). It began as an interim program in 1998 and was forecast to end in 2005. The government would decide on any further extensions. Boeing, which bought C-17 developer and manufacturer McDonnell Douglas in 1997, took on responsibility for the airframe in fiscal year 2000, while Pratt & Whitney maintained the Globemaster III's F117-PW-100 engines starting in January 1998.

Personnel at the San Antonio Air Logistics Center, who had worked diligently to bring the C-17 from its embryonic stage to maturity as the free world's top air transport, had always envisioned Kelly as both manager and maintainer of the new aircraft. Even though those dreams did not materialize, the C-17 Aircraft Systems Support Management Directorate continued to plan for the aircraft's future and took pride in every milestone the Globemaster III met and surmounted.

On May 31, 1996, Secretary of the Air Force Sheila E. Widnall signed letters of transmittal with Boeing and Pratt & Whitney for 80 more C-17s, bringing the final total to 120 by November 2004. What had begun as a target for congressional slings and arrows had proven itself, with the substantial help of Kelly personnel, a vital weapon system needed to sustain "Global Reach, Global Power."

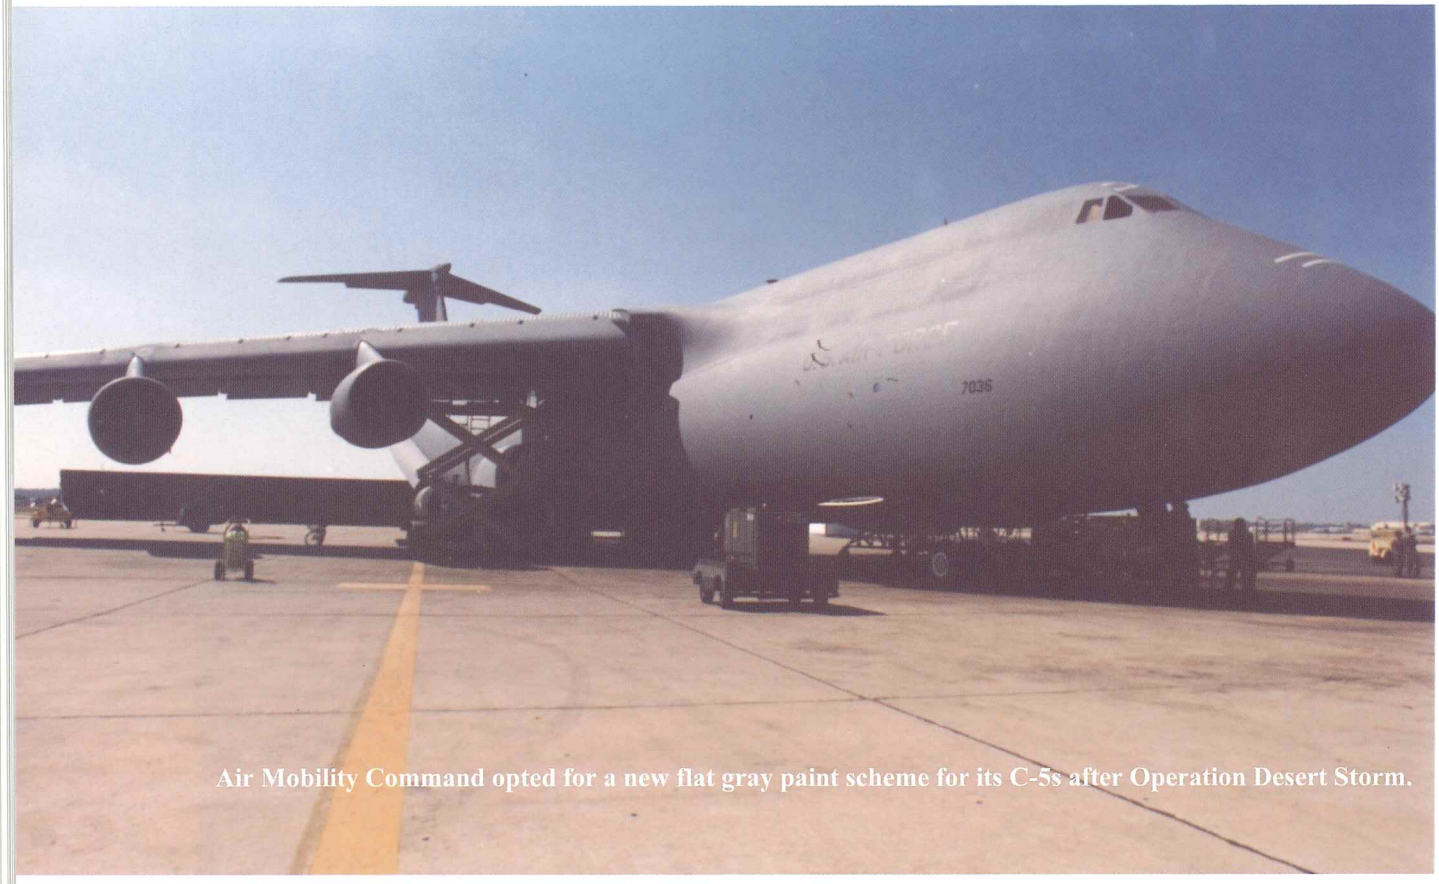

C-5 Production Suffers

In March 1991, C-5 workers at Kelly joined the nation in celebrating the lightning victory over Iraqi forces during Operation Desert Storm. They had worked long hours to push Galaxies through the programmed depot maintenance process ahead of schedule, but the celebration was short-lived. The desert war had only temporarily postponed a reduction-in-force (RIF) scheduled prior to the effort to liberate Kuwait. The Pentagon was more anxious than ever to regain the cost-cutting momentum begun in 1989 by way of the Defense Management Report to the President. Even in the face of increased taskings in the form of peacekeeping and humanitarian missions, the Air Force was forced to employ RIFs to help Congress harvest "peace dividends" made available as a result of "winning" the Cold War. In April 1991, approximately 800 San Antonio ALC personnel, many aircraft workers, were ushered out the gate either through early retirement, voluntary resignation, or outright termination.

Kelly folks lined up for their first look at the Air Force's newest jet cargo transport.

The timing of the RIF could not have been worse. Military Airlift Command needed every C-5 it could muster during the Gulf War. Those already undergoing programmed depot maintenance were rushed through the process, and those originally scheduled for maintenance were scratched from the list. When the war ended, MAC officials couldn't wait to have their used and abused C-5 armada refurbished. To satisfy customer requirements, the San Antonio Air Logistics Center recalled more than 340 of the maintenance workers it had laid off.

Air Mobility Command opted for a new flat gray paint scheme for its C-5s after Operation Desert Storm.

Military Airlift Command had presented the Air Staff with a lengthy repair list designed to put its C-5 fleet back in top operational order. At the top of the list was a request that all Galaxies receive a new coat of paint. On their numerous trips in and out of Saudi Arabia and other Persian Gulf nations, the C-5s, along with all other aircraft deployed to the Southwest Asia theater, had endured a sandblasting that removed paint—sometimes down to bare metal. It was also discovered that the European I camouflage paint scheme of mottled green, gray, and tan was a distinct disadvantage in the searing Saudi sun. When temperatures soared to 120 degrees on desert airstrip parking ramps, thermometers inside the aircraft would register 130 degrees or higher. Light gray, the color already largely employed by Tactical Air Command, became the choice of MAC for its C-5s. The color was more reflective, and the composition of the paint proved more durable and easier to maintain.

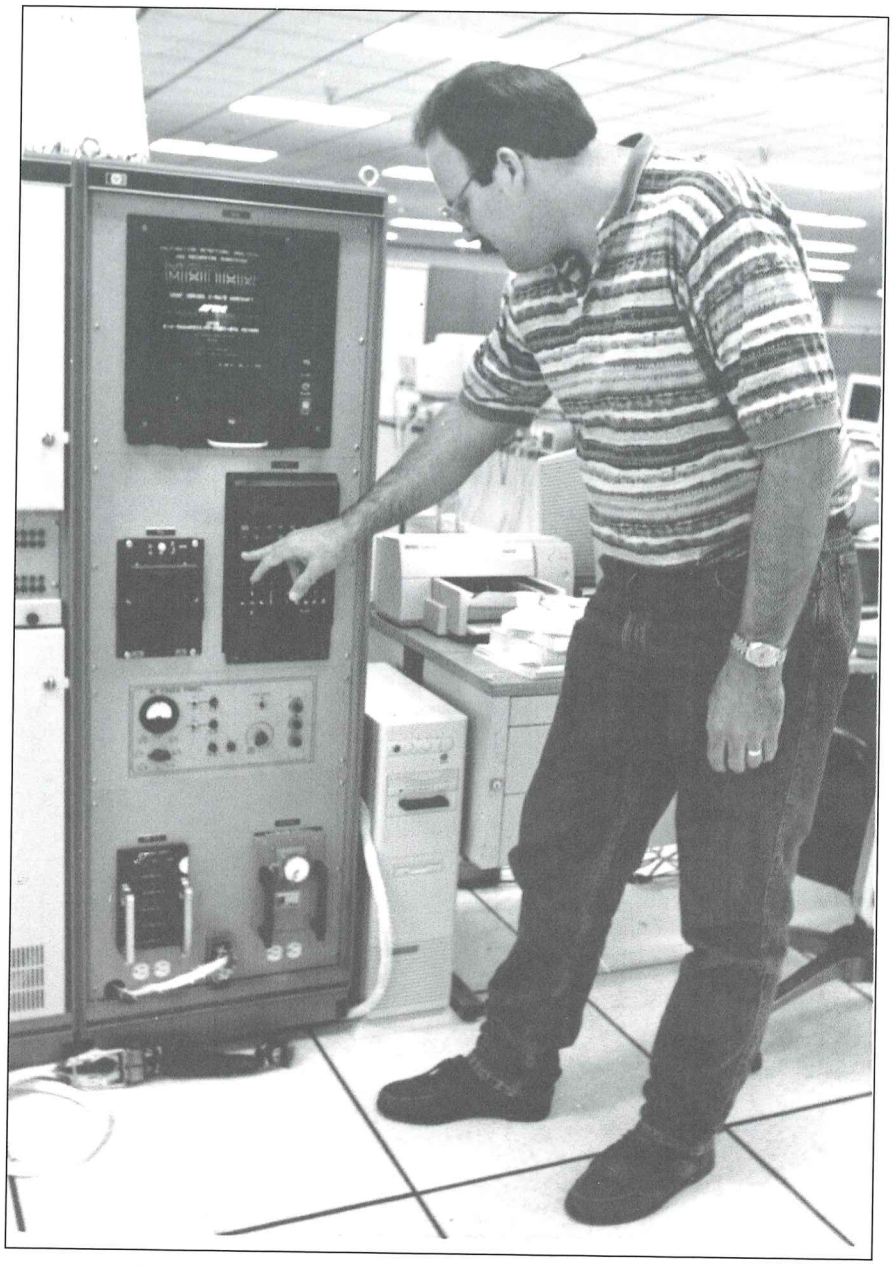

The first C-5 sporting the new flat gray paint rolled out of the Kelly paint hangar in 1991. Three more were produced during FY92, but this was not fast enough to suit Air Mobility Command. Consequently, Kelly C-5 managers awarded a contract in September 1992. Fifty-three aircraft underwent paint stripping at the San Antonio Air Logistics Center during the PDM process. Then the aircraft were flown to Waco, Texas, where workers with

Workers used plastic media to strip paint off aircraft in Kelly's new bead blasting facility.

Chrysler Technologies Airborne Systems applied the flat gray polyurethane paint which cost more than $924,000 per aircraft.

When combined with time compliance technical order changes and modifications, such as pylon fire safety systems and the second generation Malfunction Detection Analysis and Recording System (MADARS II), manhours required to perform PDM on a C-5 skyrocketed. Before the Gulf War, PDM on a C-5A required approximately 18,000 manhours. With all the new requirements, that figure climbed to around 48,000 manhours. The newer C-5B needed fewer hours–"only" 30,000. Reality finally set in, and the C-5 Division was allowed to hire more people, but not before production levels began to fall behind schedule.

The number of manhours required to perform programmed depot maintenance on C-5s skyrocketed in the 1990s.

Again, the increase in required PDM manhours came at a time when there were fewer maintenance personnel to perform the tasks. And there was another factor that helped slow the C-5 PDM effort at Kelly. In the summer of 1992, work on the B-52H was transferred to the Oklahoma City Air Logistics Center. Many who had worked on the giant bomber their entire career at Kelly found themselves assigned to the C-5. However, the transfer was not instantaneously successful. Even though most were skilled aircraft craftsmen, officials estimated familiarization with the Galaxy could take as long as 18 to 24 months. Training and certification of newly hired personnel, many with absolutely no aircraft maintenance experience, would take up to three years.

Even as managers at Kelly started planning for the increased influx of Galaxies, other world events began to complicate and foil their efforts. Open warfare and famine in northern Iraq, the Sudan, Somalia, and later in Rwanda and Bosnia-Herzegovina, caused the United States to respond with massive humanitarian airlifts, along with equipment and troops to act as peace keepers. Again, C-5s were pulled out of PDM schedules and pressed into service. It seemed the morass of world affairs was intent on dragging down with it every attempt to get the Galaxy fleet back in shape.

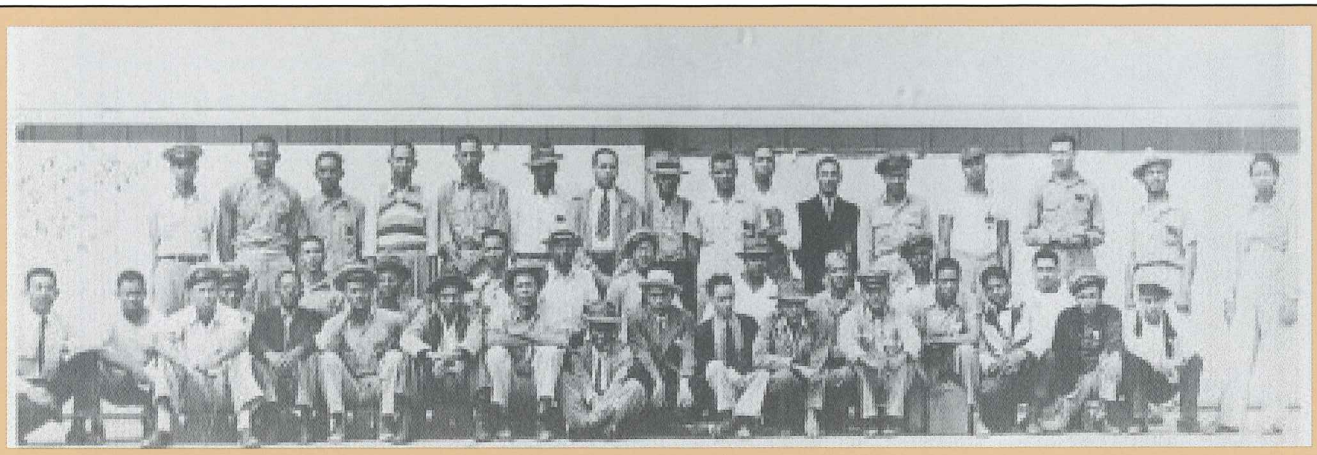

KELLY'S VETERANS' MONUMENT

In the aftermath of the allied victory in Operation Desert Storm, Kelly employees wanted to honor those who contributed to the victory. This soon expanded to the idea of a monument to pay tribute to all of the Kelly veterans, both military and civilian, who contributed to the defense of the United States during the base's long history. Officials chose a site just outside Kelly's main gate so it would be protected around the clock, but outside the base fence for easy public access. After countless meetings and numerous design proposals, the final selection for the monument was that of a large metal sculpture of the American flag on a black marble base, surrounded by a courtyard of inscribed bricks. Inscribed on the front of the marble were the words of Oliver Wendell Homes, "One Flag, One Land, One Heart, One Hand, One Nation Evermore." Members of the Veterans' Monument Committee sold individual and 16-inch square family or organizational bricks to finance construction of the monument. The Kelly Field Heritage Foundation also made a significant monetary contribution toward its construction and agreed to take responsibility for the care and upkeep of the monument and courtyard.

On December 6, 1991, the committee held the official groundbreaking ceremony, marking the beginning of construction. Members of the 307th Red Horse Civil Engineering Squadron and the 2954th Combat Logistics Support Squadron (later renamed the 651st CLSS) prepared the site. On May 23, 1992, Kelly dedicated the Veterans' Monument, capping two years of hard work and dedication by many people.

In 1995 Tommy Jordan, President of the Kelly Field Heritage Foundation and Director of the Privatization and Realignment Directorate, came up with the idea of circling the monument with a ring of 12 bronze busts to honor Kelly heroes. Emilio Torres, a talented artist and Kelly employee for over half a century, sculpted Kelly's founder, Benjamin Foulois. Retired Air Force Lieutenant Colonel Jerry McKenna, former Electronic Security Command executive officer, sculpted the base's namesake, George E. M. Kelly. The first two busts were dedicated on November 21, 1994, Kelly's 78th anniversary, and placed on two pedestals on opposite ends of the Veterans' Monument plaza.

Various organizations at Kelly lined up to help sponsor the remaining 10 sculptures. Mr. Torres eventually sculpted all of the remaining busts except one—that of Brigadier General P. D. Straw. It was done by a retired member of the 149th Fighter Group, Mel Thompson. The other Kelly "heroes" included Wilbur Miller, team leader of the "49 plus one" group of African Americans who served as ground support personnel for the Tuskegee Airmen in Alabama during World War II; Twila Donelson, who was killed in a C-5 crash while assisting the evacuation of hundreds of orphans from South Vietnam during Operation Babylift at the end of the war; Kelly worker and Native American Rudy Lorraine; Pon Tong Wong, a Chinese-American and member of Kelly's 51st Balloon Company during World War I; Emilia Sanchez, a former Kelly Katie who symbolized the women who came to work at the depot during World War II; Frederick Wendt, who represented those who left Duncan Field during World War II to move to Station X in England; Ethel Minor, a long time champion of civil rights who worked at Kelly during the Cold War; Antonio Bustamante, a Vietnam veteran; and Carpio Villareal, a Kelly employee and reservist with the 433d Airlift Wing who died in the crash of a C-5 in the early days of Operation Desert Shield.

The Forty Nine Plus One stood for this photo outside building 324 in April 1942 just before leaving to join the Tuskegee Civilian Ground Support Group. The "One," at far right, was Virginia Porter.

JOHN "MULE" MILES REMEMBERS KELLY'S FORTY NINE PLUS ONE

(taken from *Kelly Observer*, 8 Mar 00, article by Dave Stokes)

In Jan. 1942 America was at war and expanding its fighting forces every way possible. Americans of all races were helping out. Black pilots were particularly eager to fly and fight. Their cause took off in May of 1939 when the National Airmen's Association, with the help of the Chicago Defender, a Negro newspaper, sponsored Chauncey Spencer and Dale White on a 10-city flying tour. While in Washington, D.C., the pilots met and found an ally in a senator from Missouri, Harry S. Truman.

Thanks to the foresight and support of Truman and other far-thinking politicians, civilian pilot training became available at America's premier black university, Tuskegee Institute in Oct. 1940. When the War Department authorized training for the country's first black military aviators in early 1941, Tuskegee was selected as the training site for the 66th Air Force Flying School. While the "Black Wings" were being formed at Tuskegee, recruiting was begun in Jan. 1942 for black laborers to be trained to maintain their aircraft. Trainees were sought at Duncan Field Depot and other Army Air Corps depots. Forty nine men and one woman from San Antonio, the now famous "Forty Nine Plus One," accepted the challenge.

This is the story of one of them, John "Mule" Miles. A native of San Antonio, Miles still lives in the River City and retains vivid memories of his adventures while attending the special Aircraft Mechanic Journeyman Rating School and supporting flight training as part of the Tuskegee Civilian Ground Support Group.

"The idea that we were making history wasn't something we talked about," recalled Miles recently. "Mostly we were too busy. Workdays at the 66th Air Force Flying School were long and often included Saturdays and Sundays. Also, we were there to learn a skilled trade. We didn't want to spend the rest of our lives as unskilled laborers. Most of us saw going to Tuskegee as an opportunity to get ahead and at the same time help our country in the war effort. Sure, I was aware that many people thought that blacks couldn't fly airplanes," he continued. "Those of us from Duncan Field, the group we now call the 'Forty Nine Plus One,' worked hard to help black student pilots succeed. The historic importance of what we did at Tuskegee—well, that came later."

What came later was the integration of the armed forces for both military and civilians. Officially, it happened when President Harry S. Truman signed Executive Order 9918 in 1948. This was the same Harry Truman who, as a senator, was instrumental in bringing aviation training to Tuskegee. The fighting record of the Tuskegee Airmen and the groundbreaking efforts of their all-black maintenance support team at Tuskegee led the way for those who followed.

The road to Tuskegee was not easy for the "Forty Nine Plus One." Attitudes toward blacks were sometimes less than friendly in the war years. Only blacks were recruited. After all, Tuskegee was an all black school, and the pilot training was for black pilots. The reasoning at the time was that all the maintenance force would have to be black also.

"A lot of Duncan Field blacks didn't want to go to Tuskegee," Miles said. "They thought there might be problems working there. Remember that we were looking at Alabama in 1942. We had it nice in San Antonio, but didn't know what we would find in Tuskegee." As far as Miles was concerned, the chance to learn a trade offset any possible prejudice he might encounter. "I was thinking about the opportunity I had. When I tell my kids this story, I remind them that this was a chance for me to go to school and learn something—to make a better living for my family."

Leaving from hangar 324 by bus in early April 1942, the fifty maintenance trainees headed to the San Antonio train station and a long ride to Alabama. "It was 11 o'clock at night when we arrived at the station in Alabama," said Miles. "We were 18 miles from Tuskegee Institute and 12 miles from the flying school. Nobody knew where we were going or what we were going to do. Finally, we got it all sorted out and spent our first few nights sleeping in makeshift barracks."

The maintainers soon settled into the routine of training and work. Most stayed in rented rooms in private homes near their work at the flying field. A few lived on campus at the Tuskegee Institute.

On arrival at Tuskegee, the maintenance trainees didn't know what job they would be doing. "We were separated into groups based on our experience—supply, maintenance, parachute, radio repair, all the many skills needed to keep aircraft flying," Miles recalled. "I was assigned the class in aircraft sheet metal repair. The Army Air Corps military specialists were our teachers. As we gained in skills, we freed them for other duties and they transferred out."

Classroom training and learning materials were in short supply. The trainees bought their own books, studied late into the night, and tutored one another in their own study groups to learn new skills.

There was real incentive to learn quickly and to do first class work. Quality control was very personal at Tuskegee. Occasionally, some workers would be picked at random to fly in an aircraft on which they had made repairs.

Miles spent two and a half years in Alabama, returning to Kelly in 1944 as a journeyman aircraft mechanic. He retired in 1971, but his career nearly came to an end 20 years earlier when he had to choose between his love of baseball and steady paychecks at Kelly.

A native of San Antonio, Miles played basketball for St. Phillips Jr. College where he was known as Sonny Boy. "Even though I went to college playing basketball, my first love has always been the game of baseball," said Miles.

In 1946, while playing for the Kelly Field Brown Bombers, a scout asked Miles to tryout with the Chicago American Giants. "Everybody said I couldn't make the team," recalls Miles. "They said there ain't no way a Texas guy could make a team in Chicago. That may be why my boss at Kelly gave me a three-month leave of absence. He probably thought I'd be cut by Chicago and back on the job in a week.

I never shall forget that tryout. I showed up for spring training in Jackson, Mississippi. Well, I made the team and toured with them during the baseball season for the next four years. Miles, an outfielder and third baseman, hit 27 home runs in 1948 to be among the league leaders. The next season he led the Giants to the second half Negro American League title. In Chicago, Miles was known as a power hitter. After hitting two home runs in one game, his manager, "Candy Jim" Taylor boasted, "You hit that ball like a mule kicks." From then on, Miles was known in baseball circles as "Mule," a nickname he still enjoys.

After four years with the Chicago American Giants, Miles made the tough decision to leave major league baseball. The unpaid leaves of absence from his job at Kelly were leaving his shop short handed. Also, baseball paid about a quarter of what he made on his government job. Miles completed his professional baseball career with the Laredo Apaches of the Gulf Coast League in 1951. He was the only black player on the team.

The former member of the Forty Nine Plus One and baseball legend is proud of his five sons and his daughter, referring to them jokingly as his "five hits and a miss." He has carefully taught them the lesson he learned at Tuskegee and in baseball—that you can do anything if you are willing to work hard enough and if you believe in yourself. His family's success—four sons finished college, three with master's degrees and his daughter now earning her bachelor's degree—are living proof that he is right.

A Triumphant Turnaround

Prior to fiscal year 1993, the C-5 Production Division operated under a skills management concept. Although sheet metal specialists, riggers, electricians, and mechanics performed maintenance on the same aircraft simultaneously, each worked independently. Yet none bore overall responsibility for ensuring all required tasks were completed with an eye on prompt delivery. Aircraft were late returning to their users, manhour costs ballooned, and quality suffered.

Toward the beginning of FY94, Colonel Robert DeFeo, C-5 aircraft director, studied and later implemented a new management process known as the "production team" method. He formed three teams—A, B and C—each made up of approximately 120 personnel who supplied every skill needed to overhaul a C-5. Active duty Air Force captains served as team chiefs and bore direct responsibility for the success or failure of their particular group. Teams assumed "ownership" of three or four aircraft on the PDM line. Additionally, a separate team focused on repair and modification of the Galaxy's main landing gear system. As early as January 1994, the groups began to immerse themselves in the spirit of competition and teamwork. By October, flow days dropped by 13 percent, and overtime plummeted a whopping 54 percent. An amazing recovery was under way.

In late March 1994, Major General Lewis E. Curtis III, the San Antonio ALC commander, asked for a plan to limit to nine the number of C-5s undergoing PDM at Kelly. The targets were obvious—better quality and increased flow time. Planners studied the PDM Scheduling System developed earlier for the B-52 and applied it to the C-5. A road map to C-5 PDM success had been charted with clearly marked milestones.

Unfortunately, Colonel DeFeo, who helped start the C-5 Directorate on the road to recovery, was reassigned before he could see his production team concept bear fruit. However, his replacement, Colonel Peter J. Hennessey, proved more than up to the task of improving and sustaining the upward momentum. Under his leadership, FY95 productivity rose 15 percent despite a 28 percent work force reduction.

Production figures were improving, but were customers any happier with the C-5s returning from Kelly? Colonel Hennessey decided to find out. His directorate developed a customer feedback book that accompanied each aircraft back to its home station. At first, feedback was less than favorable, largely due to the vagueness of questions contained in the initial book. But when personnel at the San Antonio ALC revised the feedback book to include more specific, in-depth queries, along with ample space for customer comments, response began to turn more and more favorable.

DET 1 HELPS BOOST QUALITY

In late 1993, Master Sergeant Patrick Davis, a logistician serving at AMC headquarters, Scott AFB, Illinois, came up with the idea of employing command "blue suiters" to perform quality inspections on C-141 aircraft undergoing programmed depot maintenance at the Warner Robins Air Logistics Center. The idea so appealed to General Ronald R. Fogleman, then AMC commander, that he expanded it almost immediately to include C-5 aircraft undergoing maintenance at Kelly.

Detachment 1, 615th Air Mobility Operations Group, headquartered at Travis AFB, California, was activated at Kelly on November 1, 1993. Captain James Hannon, the first Det 1 commander, hand-picked his people, most of them C-5 certified mechanics from Galaxy units throughout the nation. Eighty-four had joined the unit by mid-1994. Prior to the founding of this organization, C-5s were arriving back at their home stations in less than acceptable condition. Inspections at these home bases turned up alarming numbers of discrepancies causing the grounding of aircraft for additional periods, averaging 28 days, until problems could be corrected.

Once Det 1 personnel began applying their trade, aircraft inspections took place during the PDM process, and home station groundings due to discrepancies quickly dropped to four days and sometimes only one. By fiscal year 1995, the C-5 Production Division was delivering perfect aircraft. Home station inspectors were finding no discrepancies. The San Antonio Air Logistics Center was acquiring a new reputation for high-quality products delivered on or before schedule.

Det 1 team members performed quality inspections on C-5s undergoing programmed depot maintenance at Kelly, and the defect rate once the aircraft returned to its home stations plummeted.

The numbers did not lie. Delivery of C-5s rose an astounding 50 percent in FY95. The C-5A aircraft were completing the PDM process 55 days earlier than in FY94, and C-5Bs were getting back to their home stations 12 days earlier. Maintenance workers produced 111,000 more labor hours than the year before and logged a 19 percent increase in direct labor efficiency, plus a 9 percent increase in output per paid mandays. Twenty-eight aircraft arrived back at their home stations with no reported defects compared to 23 major or critical defects reported the year before. In 1996 record advances in scheduling and production allowed the C-5 Aircraft Directorate to turn a $23 million profit.

Late on the evening of September 30, 1996, the last day of the fiscal year, the sixteenth and final C-5 on the FY96 PDM schedule passed its functional check flight and was delivered across the field to the 433d Airlift Wing, its owner. For the first time in too many years to count, C-5 production workers completed all aircraft scheduled for the fiscal year.

On November 6, 1996, Colonel Hennessey accepted the General Bernard A. Schriever Award, Designated Acquisition Commander System Program Director category, on behalf of his organization. Even in the face of imminent workload departure, the string of high quality, on-time deliveries continued right up to September 15, 1998, when the last Galaxy to undergo PDM departed Kelly.

Engine Issues

When politicians turn their attention to budget reduction, they tend to use a very broad brush to indicate the "cut here" line. The defense budget, which had fallen every year since the mid-1980s, was in tenuous shape even as bombs began falling on Baghdad on January 16, 1991. The short war in

Southwest Asia soon gave way to "battles for bucks" as the Air Force sought to fund for the future and maintain what it already had.

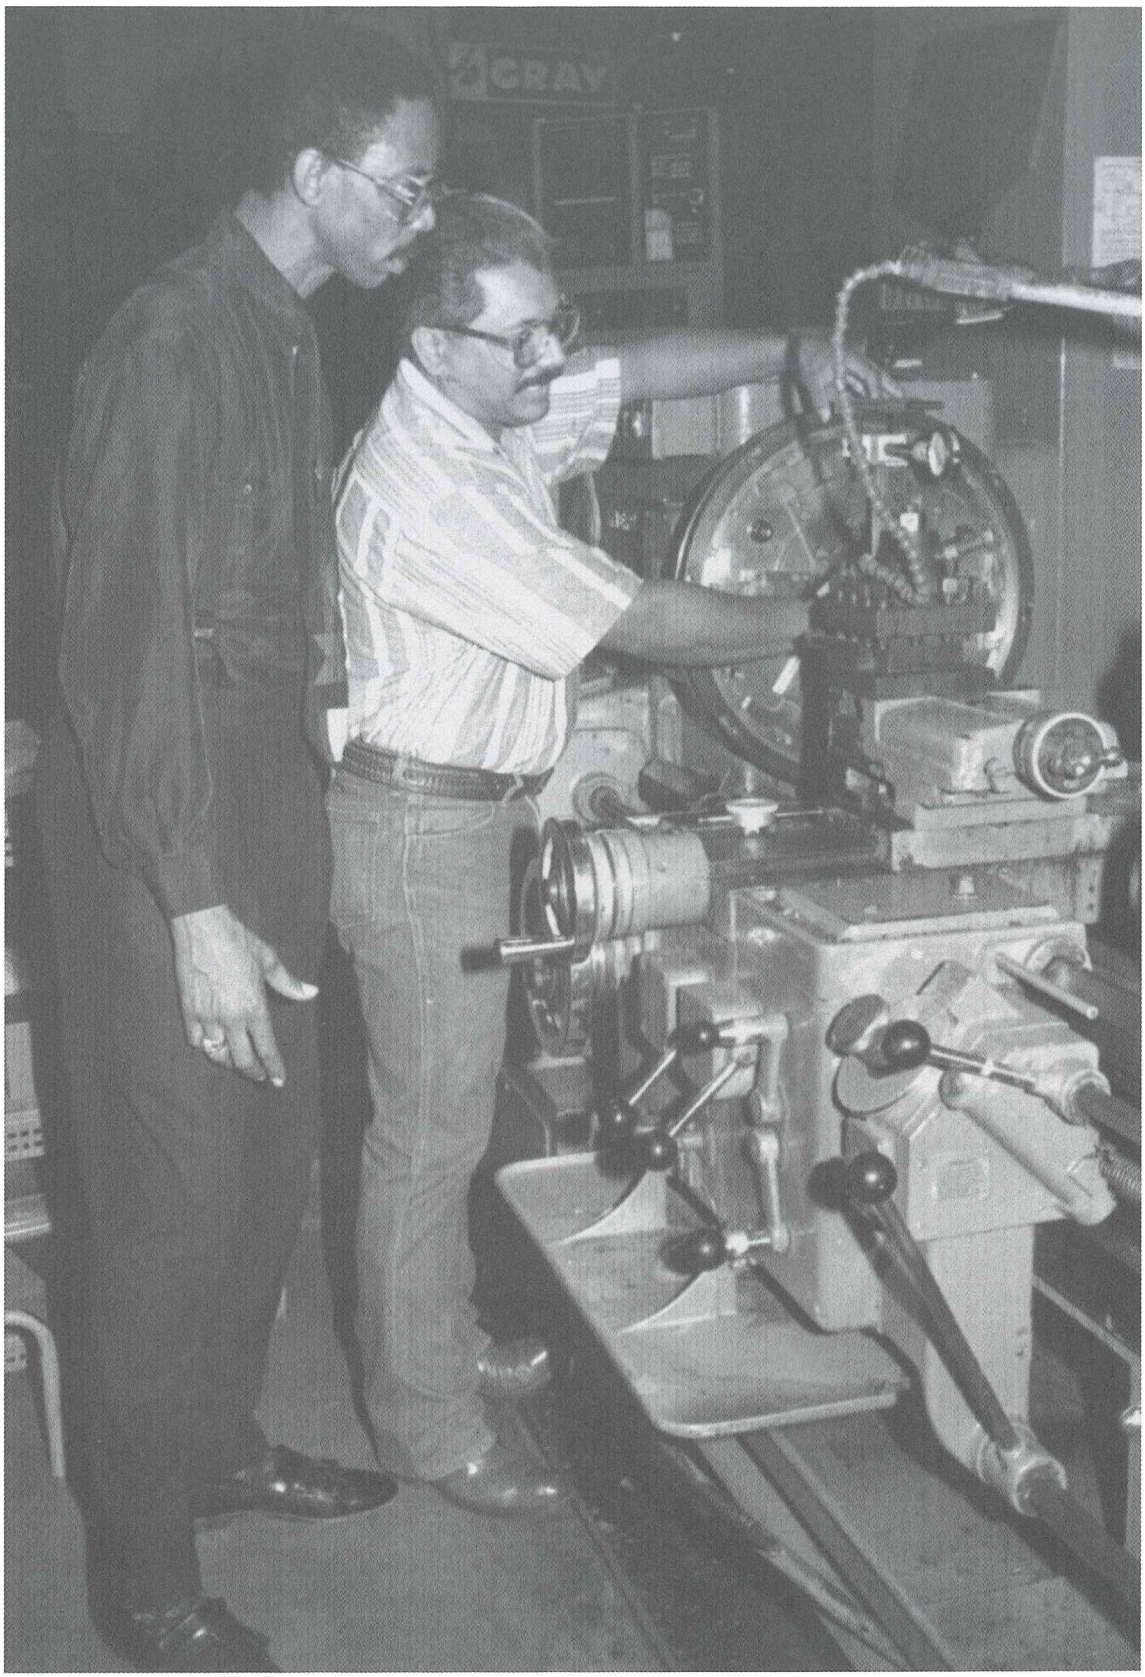

One fund that always seemed to run dry rapidly was the one that bought the parts to repair aircraft engines. During the Reagan administration, the Air Force had stockpiled billions of dollars worth of engine parts—just in case. In hopes of saving money, the Defense Department limited purchase of new parts until old stocks languishing in warehouses had been significantly slashed. Unfortunately, the over-stocked parts were often for outdated engines no longer in use.

In early 1993, officials from the San Antonio Air Logistics Center put together a briefing they called "The F100 Stock Fund Train Wreck," a graphic outline highlighting a future of severe engine shortages. In March 1993, they took it to AFMC headquarters and on to the Air Staff in the Pentagon. This briefing, plus the F100 Weapon System Program Assessment Review released the following June, exposed some stark realities. It predicted that unless more money was forthcoming, and soon, 10 percent of the Air Force's F-15 fighters and 6 to 9 percent of the F-16 fleet would be grounded for want of engines by FY95. The "train wreck" was temporarily averted the following September when Air Force Materiel Command released $68 million in funding. That boded well for the F100, but other engine programs went begging.

Unfortunately, the fiscal band-aid soon fell off the F100 financial fix. While funding increased from 48 percent in FY93 to 106 percent in FY95, it fell back to 72 percent in FY96 and plummeted to 36 percent by FY97. Greater maintenance demands and growing scarcity of spare parts due to inadequate funding caused the Propulsion Directorate to find itself in worse shape than it was when the "train wreck" of 1993 was predicted.

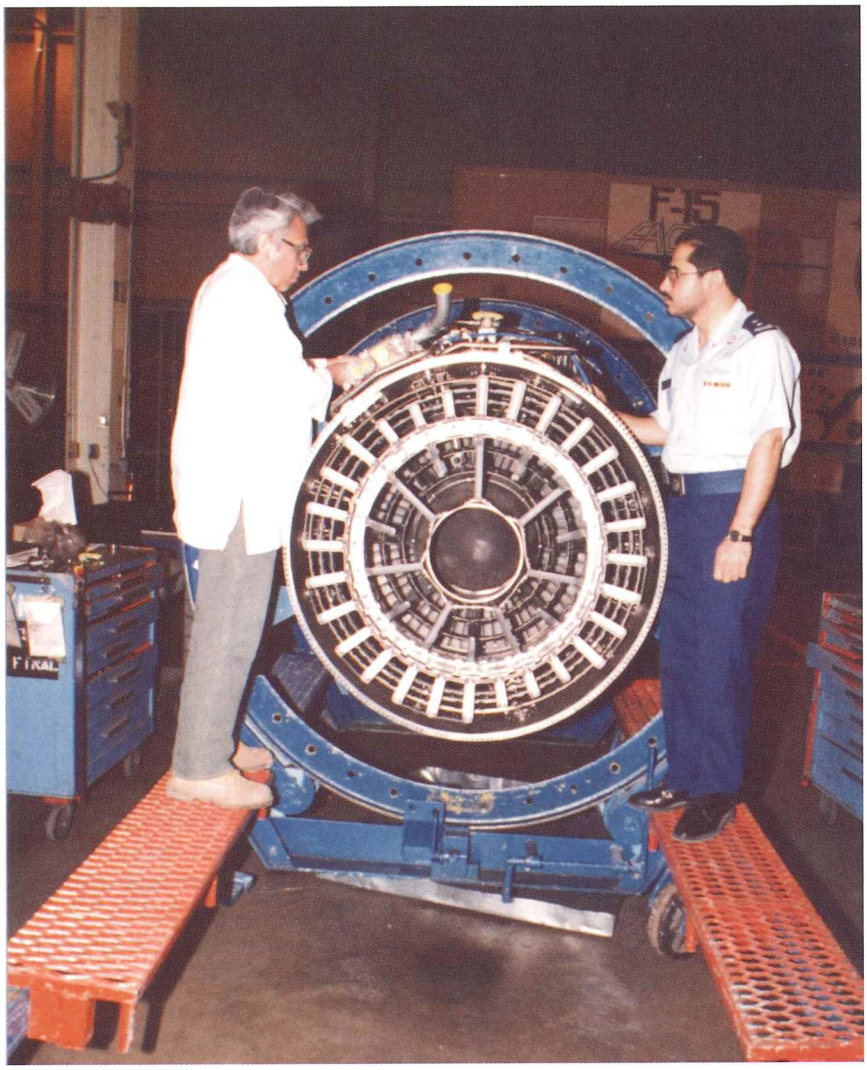

Through hard work and dedication, by 1996 Kelly personnel had performed an amazing turnaround on C-5 production rates and quality improvements.

Engine mechanics examine the machining specifications on the third stage blade lock retainer for an F100 engine.

Mechanics from the Engine Production Division prepare to install 220 engine core compressors.

The program to upgrade Royal Saudi Air Force F100 engines to -220E configuration ended on February 27, 1996, to rave reviews.

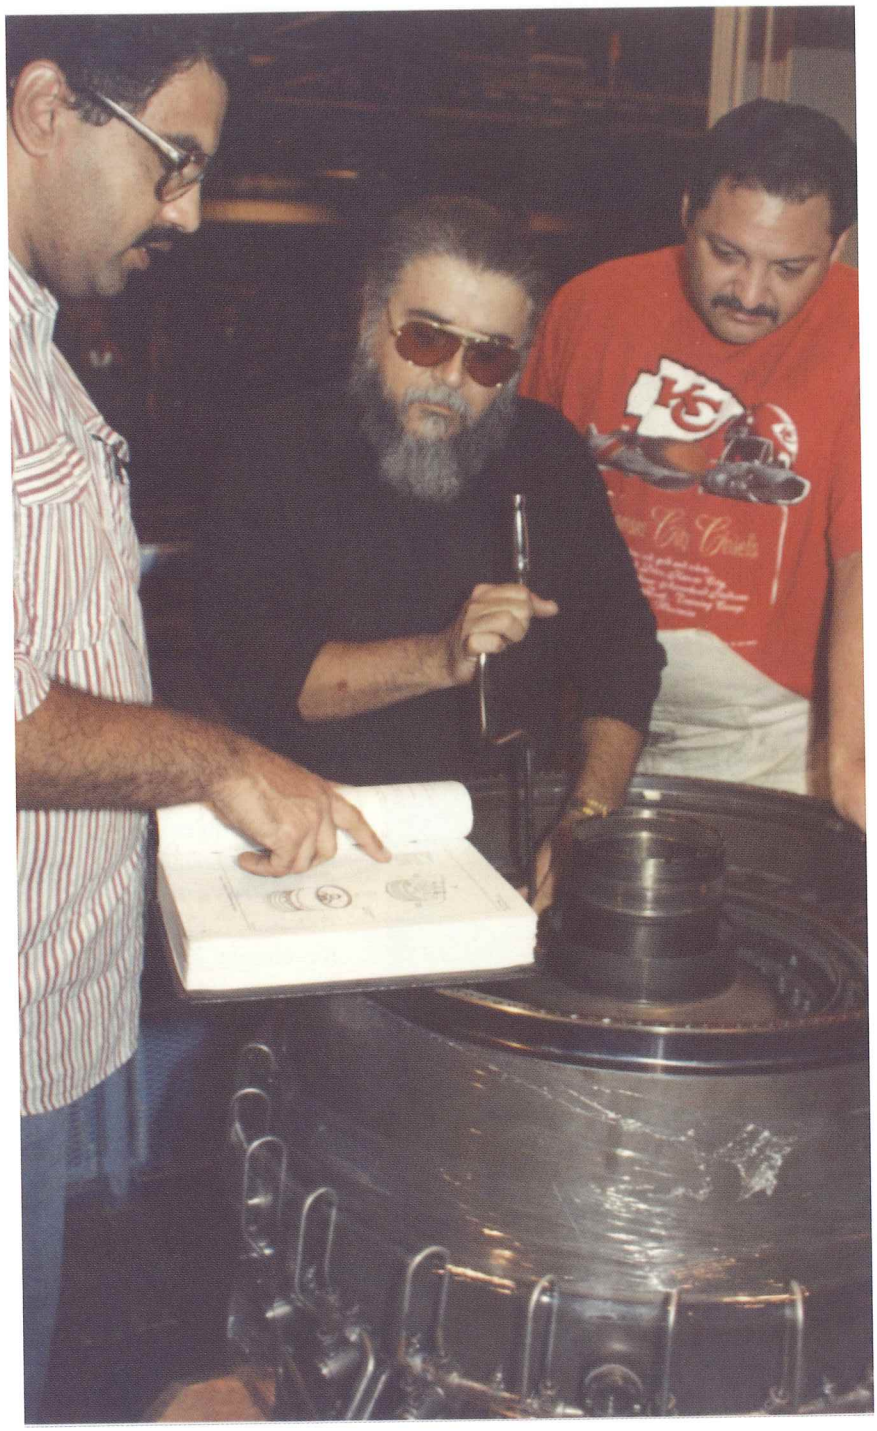

The F100-PW-100 and –200, original power plants for the F-15 and F-16 fighters, were fine until the advent of the –220 and –229 models. The upgrades offered greater power, reliability, maintainability,—and fiscal frustration. The Air Force, quite naturally, wanted to replace older engines as quickly as possible. By September 1995, 226 F-15s and 507 F-16s used the –220 and –220E upgraded models of the F100 engine. However, funding shortfalls in FY93-94 hit the –220 hardest. Continuing upgrade of older engines to create the –220E placed a steady demand on the pool of serviceable spare F100 engines.

The lack of available parts was further aggravated by a "good news, bad news" situation involving work on foreign F100 engines. The Air Force had accepted a contract in January 1991 to upgrade Royal Saudi Air Force F100 engines to -220E specifications. That was good news because the work kept Kelly propulsion specialists busy. However, the lucrative contract compounded the already serious parts shortage. Despite this, Kelly completed work on Saudi engines ahead of schedule.

The introduction of the -229 upgrade of the F100 engine in the early '90s only served to exacerbate a continuing problem. This new power plant was touted as an upgrade, but incorporated so many changes as to almost qualify as a completely new engine. As with most new jet engines, the -229 had its problems. By the time the -229 began entering the Air Force inventory, the San Antonio ALC had been tabbed for closure by the BRAC. In February 1999, the Air Force declared the Oklahoma City Air Logistics Center and its bidding partner, Lockheed Martin, winners of the Propulsion Business Area (PBA) workload competition. Tinker AFB, Oklahoma, got what it had coveted for years—the F100 engine, and all the problems associated with it.

Although the F100 workload was certainly a large piece of the PBA pie at Kelly for more than two decades, it certainly did not fill the whole pan. The TF39, power plant for the C-5 Galaxy, shared floor space in building 360. This giant of the jet engine world suffered many of the same ills that afflicted its smaller cousins—lack of spare parts funding and not enough skilled workers to keep up with demand.

For years, the TF39 engine had passed through Kelly shops in a relatively predictable flow. But increased demands upon the C-5 fleet during Operation Desert Shield/Desert Storm and subsequent

An instructor from Pratt & Whitney teaches two workers from the Engine Repair Branch how to disassemble the F100-PW-229 engine core.

humanitarian and peacekeeping endeavors began putting a strain on the TF39. More demand for overhauled engines came just at a time when severe budget cuts were being imposed. Parts for the TF39 were also in short supply.

Problems with excessive turbine inlet temperatures, an increased need for compressors, a quest to increase engine durability, a loss of experienced maintenance personnel, and the tumult created by the switch to two-level maintenance all weighed in against the center's ability to satisfy the need for the big engines.

Also, Kelly engine experts had argued for years that it made little sense to repair one engine module

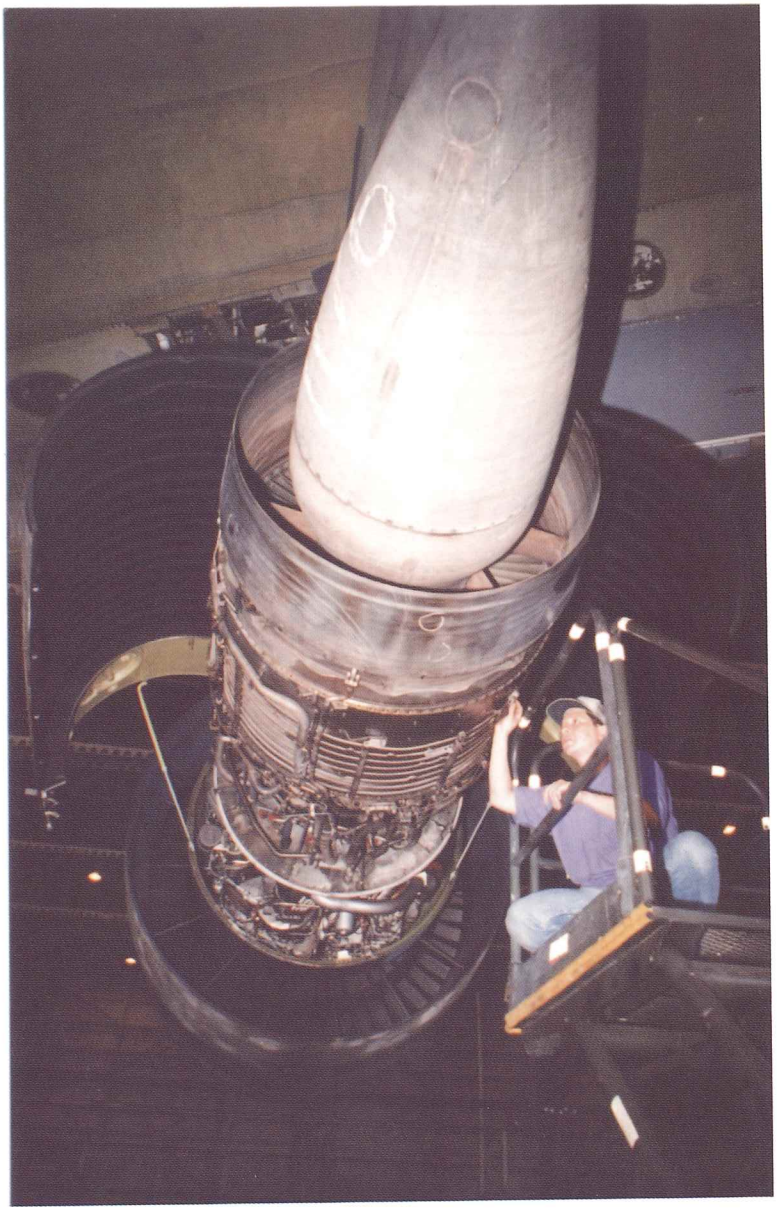

when another was likely to fail after the engine was put back into service. The argument for more comprehensive engine overhaul—fixing not only what was broken, but what was liable to break—was a difficult premise to sell to the customer. Although such a move would ultimately mean longer life for the engine, it also meant higher costs.

In 1997 the TF39 Engine Branch made significant improvements in maintenance management planning. More emphasis was given to long-term fixes rather than the "band-aid" approach. In September 1998, the TF39 went "green" (production goals were fully met) for the first time in recent memory.

The T56 engine, power plant for the C-130 Hercules, was also a major Kelly workload for more than four decades. The first T56 was overhauled in Kelly facilities in June 1957. Lockheed Martin assumed the T56 workload at Kelly facilities in 1999, and many former federal workers continued on with the commercial contractor. The Navy also used this engine in its P-3 Orion reconnaissance and antisubmarine plane. It was also used as a power generator aboard various naval vessels. As part of the drive to increase interservicing in the early 1990s, Kelly began repairing Navy T56 engines.

The Navy had four different versions of the T56; each handled by a different agency, each requiring a slightly different overhaul process, all differing from the Air Force engines. Navy T56 engines began flooding into Kelly, almost twice the workload officials had estimated. Some Navy overhaul projections overreached the target, while others fell far short. Workers in the T56 engine branch scrambled to learn the Navy way of engine overhaul. It was to their credit that they were able to do so in a relatively short time. The influx of more engines than expected was compounded by the same problems that plagued other engine repair efforts—lack of money, people, and parts.

Other engines managed but not repaired by the air logistics center fared little better than their San Antonio cousins. In the final years, months, and days of engine work at Kelly, managers and planners continued to operate under frightful fiscal constraints. Workers on the floor did the best they could with what they had. The future belonged to the Oklahoma City Air Logistics Center.

In the 1990s, a tremendous strain was put on the TF39 engines because of the increased demand for C-5s.

The Czar of All the Engines

With the merger of AFLC and AFSC in 1992, engine sustainment centers at the Oklahoma City and San Antonio ALCs, along with the other command organizations that dealt with engines, took IWSM to heart and sought establishment of a central point of contact. Tinker wanted the propulsion product group manager (PPGM) there. Kelly wanted the "Engine Czar" on its turf. Kelly won.

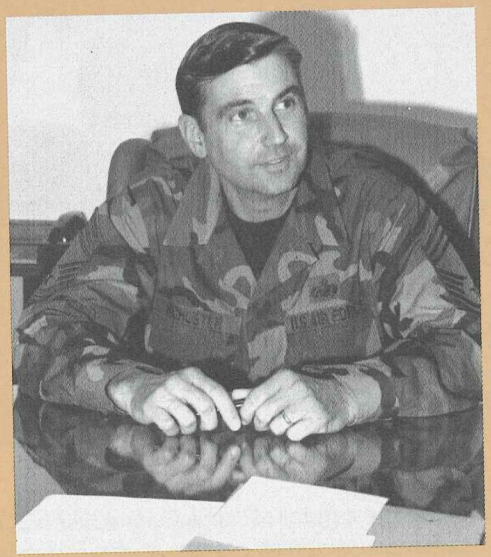

SENIOR ENLISTED ADVISORS

In 1967 the Air Force created the post of Chief Master Sergeant of the Air Force (CMSAF) as a direct conduit between the Air Force Chief of Staff and the enlisted force. Although establishment of the new post was a tentative step, Air Force leaders began working to enlarge the effort. One of the first orders of business was to establish a web from the CMSAF office in the Pentagon out to the major commands and subordinate units. In the case of Air Force Logistics Command, the communications channels spread to the various air logistics centers and other units.

A major debate in the late 1960s revolved around what to call the senior noncommissioned officers (NCO) who were to fill in these top enlisted positions. Senior NCOs were already serving as sergeant majors at various levels, but the title wasn't popular and soon gave way to "Senior Airman Advisor" or "Senior Enlisted Advisor." In 1970 the Air Force deputy chief of staff for personnel ended the controversy. He gave commanders authority to establish a senior airman advisor position if they felt the requirement existed. However, the Air Staff's top personnel officer stated, "Use of the title of Senior Enlisted Advisor (SEA) for such positions is considered appropriate."

The San Antonio Air Materiel Area commander, Maj Gen Willian H. Reddell, appointed Chief Master Sergeant (CMSgt) Eugene R. Radford as main Kelly's first SEA. Ten chiefs would follow in his footsteps.

On November 1, 1998, the Air Force announced that SEAs would become command chief master sergeants, a title similar to the Army's super E-9 grade of command sergeant major. Several reasons were given for the change. One cited closer alignment of job titles with service counterparts. Another involved increased joint service operations and easier rank identification in a mixed service environment. Consequently, CMSgt William Schuster became the San Antonio Air Logistics Center's first and last command chief master sergeant.

Major General Lewis E. Curtis III, the San Antonio ALC commander, designated acquisition commander for propulsion systems in March 1993, was anxious to fill the new PPGM position. He appointed Edward Riojas, Financial Management director, acting PPGM on July 12, 1993. A year later Robert May filled that post on a permanent basis. He immediately began laying the foundation for future strategic planning, development of common metrics for all Air Force engines, along with solid metrics for two-level maintenance. That was just the beginning.

May hit the ground running, at first attempting to employ short-term fixes to the nagging problem of engine support, but always with an eye on possible long-term solutions. The Air Force chief of staff weighed in on the problem in FY95 and out of his concern came the Executive Independent Review Team (EIRT), chartered by the propulsion product group manager.

Robert May became the Air Force "engine czar" in July 1994.

On December 6, 1996, May tasked the newly formed EIRT to come up with solutions to unacceptable shortfalls in engine base stock levels and war readiness engines and solutions to stem the rise in the number of engines declared not mission capable. Although the EIRT came up with a number of causes and possible solutions, they prefaced their reports by repeating what had been evident for many years. Declining budgets, fewer personnel, and high operations tempo made for an impossible mix. When base closures and realignments, the Defense Logistics Agency bureaucracy, a switch to two-level maintenance, and "lean logistics" were added in, it became clear this cake simply would not bake.

Although studies commissioned by the propulsion product group manager identified a variety of long- and short-term solutions, nothing short of a total overhaul of practices as they applied to engine support, from the Air Staff on down, would come anywhere close to fixing the problem. This headache would follow the PPGM office to Tinker AFB in 2001.

BUILDING 1614 FIRE

Early in the morning of July 31, 1995, Kelly AFB firefighters responded to a fire located in building 1614. Once there, they noticed smoke pouring from the south end of the building where "The Landing" restaurant and airfield passenger terminal were located. Firefighters cut out a cross section of the roof to extinguish the blaze and prevent flames from spreading to the building's remaining 15,900 square feet.

Investigation revealed the fire's point of origin was a wood rafter below the wooden roof. A short circuit in the 1943-era cable was found to be the culprit. The fire caused an estimated $1.8 million in damage, forcing the passenger terminal, the main kitchen serving restaurants around the base, and the Traffic Management/Household Goods and Scheduled Airline Traffic Offices to be relocated to temporary facilities.

Kelly officials believed that airfield operations and numerous critical missions would be negatively affected if the building were not repaired in a timely manner. As a result, Air Force Materiel Command programmed the repair funds. Within a year, work was completed, and the relocated offices moved back into building 1614.

CHAPTER TEN

KELLY FOREVER

In the mid-to-late 1980s, as the Cold War began its terminal thaw, the military that helped cause communism's meltdown saw itself besieged as Congress looked for ways to balance the federal budget and whittle away at the spending deficits it had created. As Congress and the Department of Defense (DOD) downsized the military, the services found themselves with significantly more facilities than they needed or their reduced budgets could support. It was imperative for the services to close unneeded military installations, both in the United States and overseas, to avoid draining increasingly precious resources from training, maintenance, and other readiness activities.

1993 BRAC

On October 24, 1988, Congress passed Public Law 100-526, the Base Closure and Realignment Act, which tasked the Secretary of Defense to establish an impartial commission to study and recommend defense facility closures and realignments. The Commission on Base Realignment and Closure (BRAC) was formed ostensibly to "take the politics out of the base closure process." Five Air Force bases, one National Guard facility, eight Army installations, and two Navy stations appeared on the commission's 1989 "hit list." When a similar group convened in 1991, the name had changed slightly to the Defense Base Closure and Realignment Commission, but the media continued to address the commission as the BRAC.

Ultimately, the service secretaries had the difficult task of compiling lists of facilities they thought should be closed or realigned. That list went to the Secretary of Defense who forwarded it to the BRAC Commission. The commission studied the installations, heard from local communities about the effect closure or realignment would have on their economic well being, and submitted its closure and realignment list to Congress. Lawmakers only had two options: accept the list in total or vote it down completely. The final decision rested with the President who was also restricted to the "all or nothing" options.

Kelly personnel were somewhat serene in their belief that the Defense Department would never consider the oldest continuously active airfield in the Air Force for closure. House and Senate members from Texas hailed Kelly as a bastion of Hispanic upward mobility

Cindy Lynca, an instrument mechanic, adjusts the pito static lines between the engines of a B-52H undergoing depot level maintenance at Kelly.

Air Force Materiel Command (AFMC) remained untouched in the closure process until March 12, 1993, when the Defense Department released its recommended list. It included two AFMC facilities among 31 major installations proposed for closure: the Aerospace Guidance and Metrology Center at Newark Air Station in Ohio and the Sacramento Air Logistics Center at McClellan AFB in California. But the final list Secretary of Defense Les Aspin submitted to the BRAC commission on March 15 was suspicious by its omissions: Secretary Aspin had removed McClellan AFB and the Presidio at

Monterey, both in the politically important state of California. It seemed the firewalls built into the BRAC process were less than effective when subjected to intense political heat. Accusations of injecting politics into the base closure process followed. Proving their independence, the commissioners added McClellan and the Presidio back to the list.

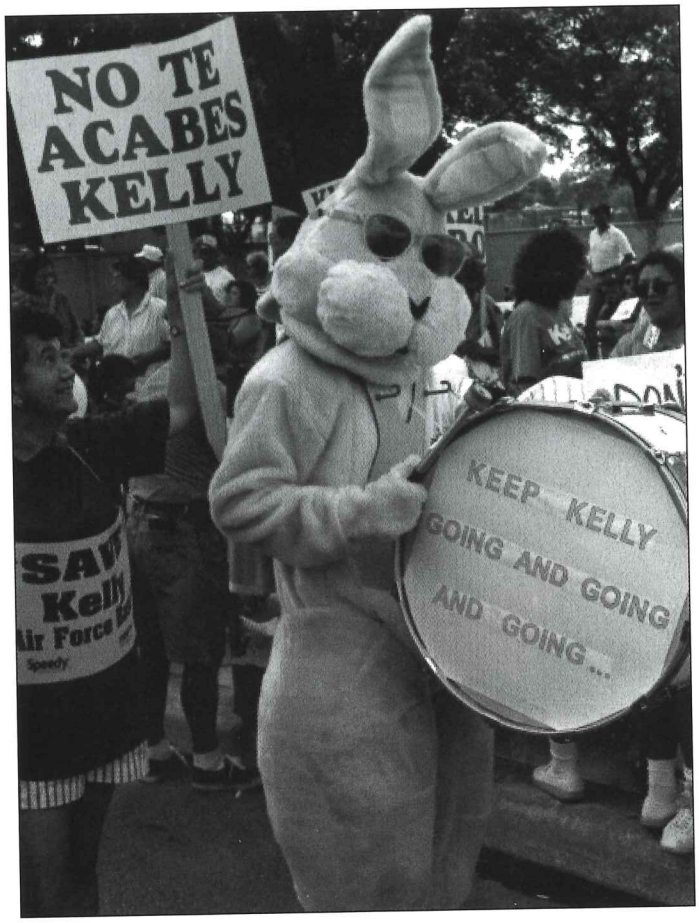

Governor Ann Richards came to San Antonio on June 1, 1993, to show her support for Kelly AFB.

However, the BRAC commissioners did not stop there. On May 21, 1993, they added 69 other installations to their closure consideration list. Among them were the Oklahoma City Air Logistics Center (ALC) at Tinker AFB in Oklahoma, the Warner Robins ALC at Robins AFB in Georgia, and the San Antonio ALC at Kelly AFB in Texas. It was small consolation to the 12,000 civilian employees at the San Antonio ALC that the commission added Kelly only to be "fair." For some reason, the Ogden ALC at Hill AFB, Utah, was spared.

The May 21 announcement served as a dramatic "wake-up call" for San Antonio civic leaders. They quickly scrambled to develop strategies to save Kelly, which all considered the ladder San Antonio Hispanics had used for more than five decades to climb to middle class economic prosperity. From the workstations of building 375 to the halls of Congress rose the battle cry, "No te acabes Kelly," which liberally translated meant, "Kelly, never go away."

Nelson Wolff, then mayor of San Antonio, asked the Greater San Antonio Chamber of Commerce to spearhead the local effort to make the case for retaining the city's largest employer. Tullos Wells, an experienced trial lawyer and chamber vice president, led the Case for Kelly Task Force, which planned and presented a comprehensive, coordinated picture of Kelly's importance to the Air Force and San Antonio.

One of the first to mount the battlements was Texas Governor Ann Richards, noted for her fiery oratory. On June 1 she roused a gathering of more than 500 Kelly employees. "We are in a fight for our lives with Kelly AFB," said the governor. "This is as serious as a heart attack and you are going to have to talk to your friends, to your neighbors, to your fellow workers and tell them that we are going to fight to the death to save Kelly AFB. . . ."

In his briefing to the BRAC commissioner, General Lewis E. Curtis III, Commander of the San Antonio Air Logistics Center (SA-ALC), emphasized four basic points. San Antonio, like the other ALCs, was more than a maintenance depot. Unlike the other services, the Air Force ALCs benefited from a unique synergism with the collocation of system and program management, engineering support, commodity and item management, and overhaul and repair capabilities. According to General Curtis, the San Antonio Air Logistics Center was the heart of the nation's strategic airlift capabilities as the manager and depot maintainer of the C-5 and C-17 cargo transports and the TF39 and T56 engines for the C-5 and C-130, respectively. Furthermore, the San Antonio ALC was a world class depot with unmatched capabilities in terms of productivity, quality, unique work force, and value to the American taxpayer.

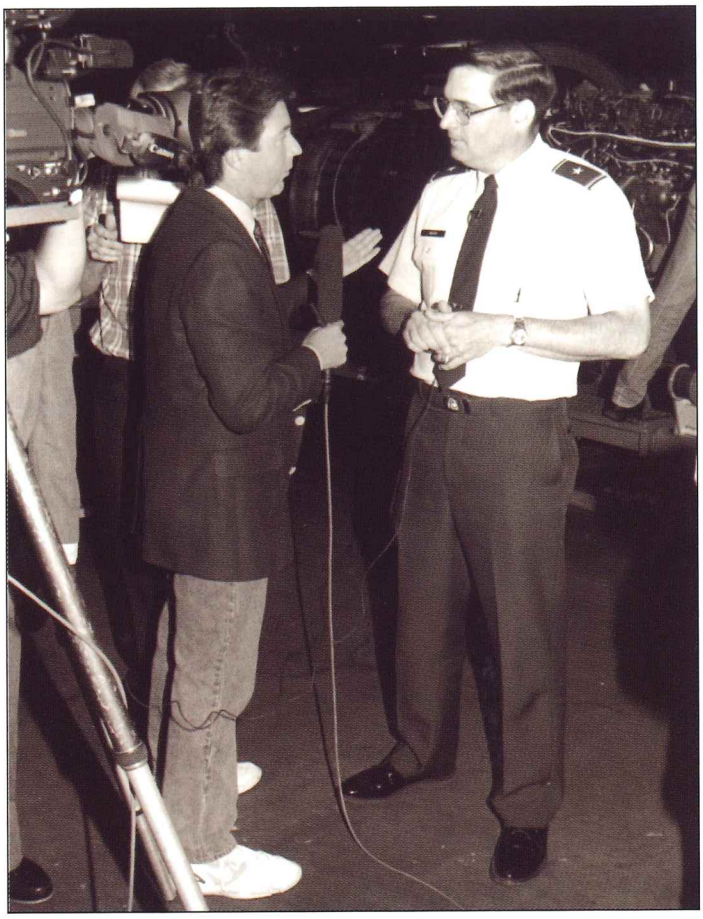

The following day, June 6, the population of Corpus Christi, Texas, swelled by an additional 1,500 people. They were mostly Kelly workers and their San Antonio supporters who had boarded a fleet of buses at 3 a.m. for the trip to the coast. The full BRAC commission was meeting to discuss recent finding and hear testimony. While several hundred Corpus Christi area residents turned out for

Beginning in late May 1993, BRAC commissioners fanned out from Wichita Falls to Corpus Christi visiting installations on their Texas list to assess their potential for closure or realignment. Peter Bowman, a former commander of the naval shipyard in Portsmouth, Maine, was the commissioner who drew Kelly. He arrived at the San Antonio International Airport on June 5, greeted by more than 200 people waving placards and wearing blue "Kelly Proud" t-shirts.

When the bus turned onto General Hudnell Drive, Commissioner Bowman was greeted by 20,000 people, who lined the final three miles to Kelly, shouting slogans and waving signs in support of the base. "I searched through the eight criteria by which we are supposed to judge installations, and I didn't come up with one that exactly equated to the crowds out there," Bowman told officials.

Peter Bowman, left front, was the BRAC commissioner who visited the San Antonio ALC in June 1993. At right is Maurice LeBlanc from the Kelly Propulsion Division.

At left, Brigadier General William F. Moore, the SA-ALC vice commander, announced to the local media that Kelly AFB was no longer on the BRAC commission's closure list.

At right, General Curtis gives Kelly workers the good news.

Much of the engine depot repair work done at the San Antonio Air Logistics Center required time-consuming attention to detail.

a rally to show support for their bases, the BRAC commission was visibly affected by the strong showing of San Antonio supporters who also showed up for the hearing. After watching the large group of people, many of them wearing "Kelly Proud" t-shirts, walk quietly into the hearing room, one of the commissioners remarked, "I wonder if there's anyone left at home in San Antonio?"

While other Texas military facilities on the base realignment and closure list depended on defenders such as retired generals and admirals, San Antonio took a different tack. The major spokesperson for the Case for Kelly was an aircraft electrical work leader named Cindy Frias, a 12-year employee at the base. She expressed pride in workmanship and spoke of long duty days, production surges during Operation Desert Shield/Desert Storm, and a dedication that permeated the entire Kelly work force. "In order to close Kelly, you [the BRAC commission] must look 20,000 people in the eye and tell us we're not the best. If you have the facts correct, you won't be able to do this," said Frias.

On June 23 the commissioners voted unanimously to remove all the air logistics centers from their list. The only AFMC closure casualty was Newark Air Station, home of the Aerospace Guidance and Metrology Center. But even as South Texas rejoiced over the outcome, the victory in 1993 was but a prelude for a bigger battle in 1995 when everyone expected political pressure would be ever greater to cut one or maybe two of San Antonio's military bases.

The Lull Before the Storm

Even though the San Antonio Air Logistics Center came away from BRAC '93 unscathed, that silver lining diminished as the storm clouds of BRAC '95 began to gather. Predictions from the Office of the Secretary of Defense (OSD) spoke of

massive cuts to pare down excess military depot capacity. Unlike the rest of the Air Force, AFMC had failed over the past decade to keep pace with reductions in personnel and facilities. Now AFMC found itself and its five ALCs under close scrutiny.

As the Air Staff's newly formed Base Closure Executive Group (BCEG) began its evaluation and ranking process, the five ALCs began major pushes to ensure their production figures were the best and not the worst. It was the BCEG's list that would go forward to the Secretary of the Air Force, from there to the Secretary of Defense, and ultimately to the BRAC commission.

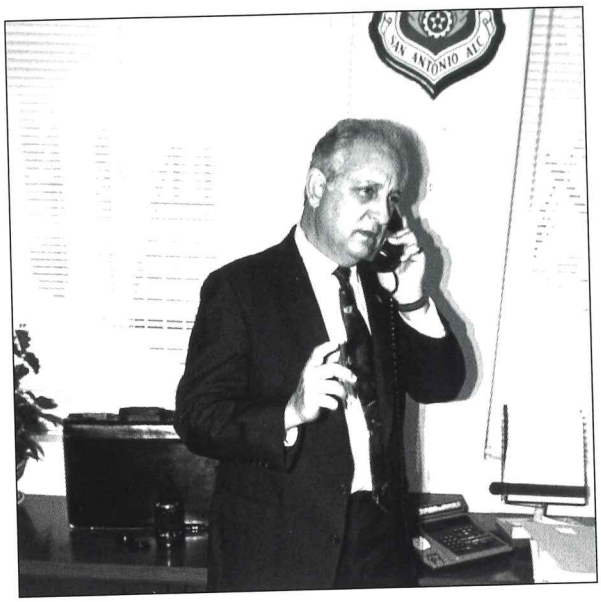

approval. Quality and performance difficulties plagued the C-5 programmed depot maintenance (PDM) process, and T-38 production got off to a false start due to lack of experience on small aircraft. Additionally, engine repair costs shot up with little or no warning to the customers. In the middle of 1993, center engine managers alerted the Air Staff to the F100 "train wreck"—a lack of F100 engines caused by spare parts underfunding in the early 1990s. Overall, the Depot Maintenance Business Area (DMBA) hourly costs at the San Antonio Air Logistics Center went from $47.20 in FY92 to $55.58 in FY93. Predictions were for the hourly cost to rise to $64.38 in FY94.

Amidst all the BRAC concerns, work still continued at Kelly. In May 1993 the XC-99 returned to Kelly for restoration. Also on the runway was NASA's space shuttle, the *Columbia*.

After being in the enviable position in 1993 of having the lowest rates and costs and the highest quality indicators of all the defense depots, at the beginning of the third round of BRAC, the San Antonio Air Logistics Center found its rates had climbed dramatically. The center faced three major challenges: profitability, performance, and customer

General Curtis viewed 1994 as a "year of preparation." He believed the center had met some very tough challenges over the past two years, citing the loss of the B-52 workload in 1993 and the tough learning curve its workers faced as they began work on the T-38, changes in how the C-5 flowed through depot maintenance, increases in engine production,

Edward Riojas was the first Executive Director of the San Antonio Air Logistics Center.

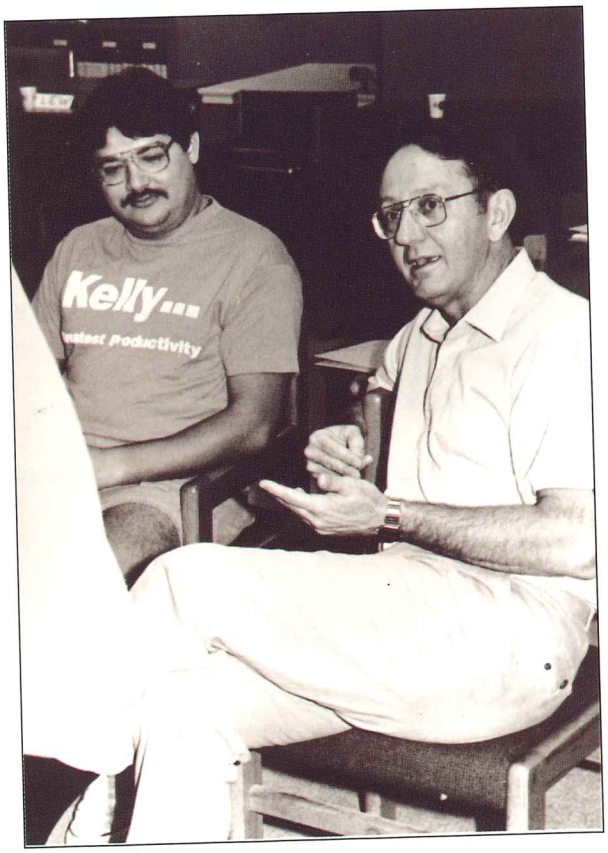

reorganization, and reductions-in-force (RIF) that helped the ALC "right-size" in the face of inevitable Defense Department drawdowns. Furthermore, it was the first full year of operation under two-level maintenance for the F100 engine with managers bringing the TF39 and T56 under the new maintenance concept.

Guided by a newly drafted strategic plan, the San Antonio Air Logistics Center began a major business recovery in 1994. The center reduced its work force by more than 1,000 employees, using a combination of bonuses for retirements or resignations and layoffs. General Curtis challenged Kelly workers to increase productivity by 10 percent in 1995. Despite a smaller work force, production picked up across the ALC with a corresponding increase in customer satisfaction.

While the center remained the most cost-efficient depot in 1993, the same could not be said about 1994. As fiscal year 1994 ended, cost per production hour had risen to $60.92. Even though this was well below the $64.38 predicted, with BRAC '95 right around the corner, this was still not good enough to qualify the San Antonio Air Logistics Center as the most cost effective depot in the command. General Curtis established a goal of $54.28 per standard hour by February 28, 1995, one day before the Secretary of Defense announced the proposed closure list for the final BRAC round. The battle cry around the San Antonio ALC became "$54 in '95."

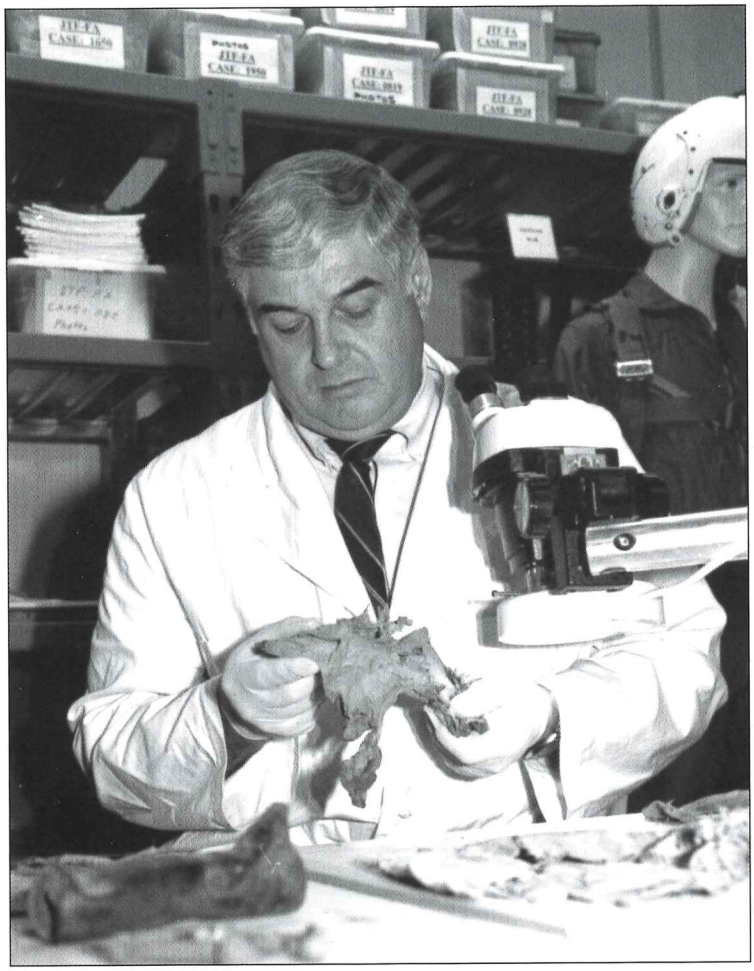

A major reversal of attitudes and actions between labor and management helped the center strive toward the $54 mark. For too long, labor-management relations at the San Antonio ALC were not only hostile, but combative. Throughout the Air Force, Kelly had a reputation of having "terminal labor relations problems," and that reputation grew. General Curtis knew the adversarial relationship between labor and management hurt productivity as wide-spread mistrust and a lack of communications between the two groups touched every facet of business at the center.

On October 1, 1993, President William J. Clinton signed Executive Order 12871, directing labor-management partnerships across the federal

Carlos Heras, the Local 1617 steward for the civilian personnel organization at Kelly, listened as General Curtis made a point in a labor management team building session.

government. Despite lack of official Air Force guidance on how to implement the executive order, the San Antonio ALC participated in a series of initiatives designed to foster a new partnership through

At the Life Support Laboratory, Mike Grost examines a piece of wreckage from a crash site in Vietnam.

more effective communication. The center's success depended on how quickly its union, Local 1617 of the American Federation of Government Employees, and the San Antonio ALC became true partners.

For the next several months, center leaders and union representatives attended teambuilding and other training sessions designed to abolish walls that separated them in the past. In April 1994, representatives from the Federal Labor Relations Authority briefed the two groups on alternate dispute resolution techniques. At the end of the training, management and Local 1617 officials signed a joint resolution establishing eight common goals to bring the two into a working partnership. Primary among them was establishment of an effective alternate dispute resolution process and achievement of a $54 rate by February 1995. In July the San Antonio Air Logistics Center became the first Air Force organization to implement an initiative under a partnership agreement, and these efforts produced an almost immediate improvement in the working relationship between labor and management. From having the highest number of unfair labor practice complaints filed in AFMC, the San Antonio ALC almost overnight became the lowest. The union became a true partner in center operations, making inputs to the commander's decision-making process and participating in every event of importance at the ALC.

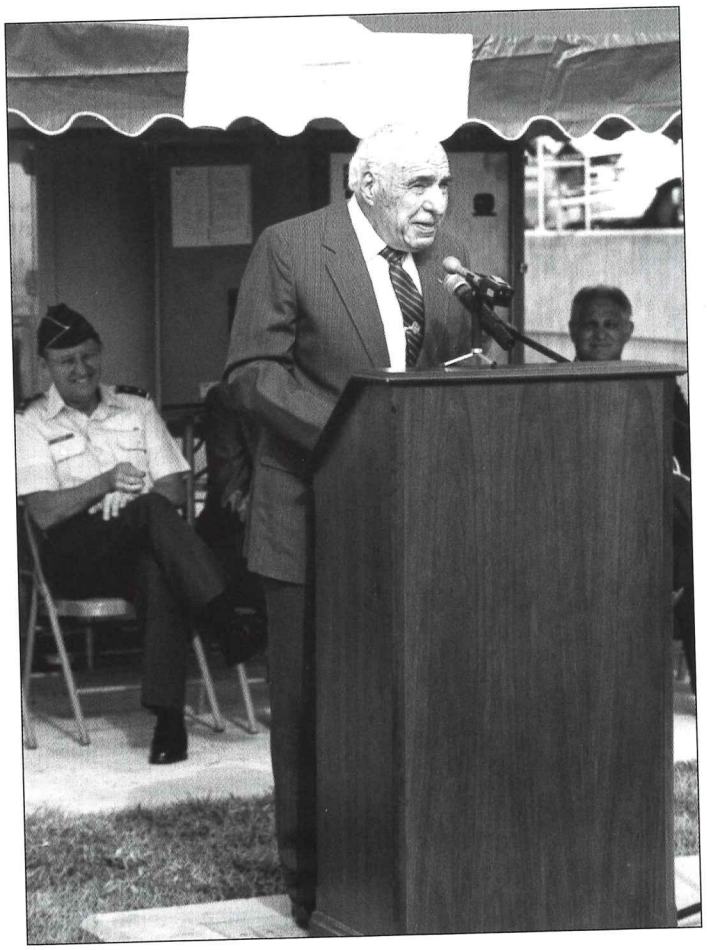

Both management and Kelly's union sponsored the $54 in '95 program, a fast-track suggestion program to solicit and implement ideas to lower the ALC's rate. The joint effort integrated the center's suggestion program, quality councils, and team and employee ideas. Although unable to meet the goal of $54 by February 1995, the SA-ALC rate fell to $58.77, a significant improvement over the $60 rate in 1994. During the remaining months of FY95, the rate continued to fall, and by September the rate went even lower than Curtis' goal, reaching $54.21, a truly remarkable feat.

Water Wars

While continued concentration on customers, values, and people was important for the ongoing recovery and survival of the San Antonio ALC, other things affected the center's future that were beyond its control. One of these was the availability of water. Kelly and the city of San Antonio sat on top of the Edwards Underground Aquifer, the metropolis' sole source of drinking water. The aquifer was also the primary water source for Bexar, Kinney, Uvalde, Comal, and Hays counties. San Antonio's astounding population growth and increased use of the aquifer for irrigation in the surrounding counties prompted the Lone Star Chapter of the Sierra Club, in partnership with the Guadalupe-Blanco River Authority, to file suit in the early 1990s against the federal government. The suit alleged endangered species in the San Marcos and

Comal Springs, fed by the Edwards Aquifer, would die unless pumping limits were placed on the aquifer. A federal judge agreed.

The BRAC commission noted Kelly's water situation in 1993, but it had little impact on its decision to scratch the base from its closure list. But the Sierra Club wasn't finished. In response to its perception of city inactivity to devise an alternative water source, the Sierra Club, in April 1994, sent the federal judge a plea to declare a water emergency in San Antonio. Club lawyers sent a copy to the BRAC '95 commission, which had already convened to begin consideration on the next round of base closures. While the judge declined to declare an emergency, the timing of this problem made Kelly and city officials fear that the water issue might have a negative impact on the commissioners' decision. The city came up with a solution titled "The 2050 Water Plan," but failure of the citizens of San Antonio to accept the strategies proposed by civic leaders to provide additional water sources did not help. Sensing which way the August 1994 vote would go on the 2050 Water Plan, center environmental managers began a water reuse study to identify ways to reduce Kelly's demand for water from the Edwards Aquifer by another 40 percent through the use of treated waste water for industrial processes. In addition, senior center officials worked successfully with their city, state, and federal counterparts to ensure Kelly would always have the water it needed. Nevertheless, the center faced an arduous battle to convince officials in Washington, D.C., that Kelly did not have water problems.

Representative Henry B. Gonzalez told supporters the future of Kelly was assured so long as the BRAC process did not become a game of politics.

BRAC '95

As the San Antonio ALC faced the final BRAC round, most people at Kelly felt cautiously optimistic. Center personnel had made significant strides in 1994 in turning around the downward trends that plagued the ALC in 1993. Profitability and productivity were up, and customers were more satisfied with products and services provided by the SA-ALC. Many others worked to put Kelly in a positive light during the fall of 1994. San Antonio Mayor Nelson Wolff established the BRAC 1995 Task Force to stave off closure of any city military installation. It was headed by retired Brigadier General Paul Roberson and co-chaired by Jesse Villarreal and Charles Cheever, two prominent local businessmen. Local union president Lourdes Rodriguez held a BRAC '95 Town Hall meeting on November 1st to inform residents and Kelly workers how to fight to protect the base. Guest speakers included Congressman Frank Tejeda (Democrat-Texas), Mayor Wolff, and Chamber of Commerce president Joe Krier.

San Antonio's lawmakers also campaigned on Kelly's behalf. The 30 members of the Texas congressional delegation signed a letter on October 7, 1994, supporting Kelly in the upcoming closure round and urging the President to "remove political considerations" from the BRAC process. Texas lawmakers breathed a sign of relief on January 31, 1995, when Deputy Defense Secretary John Deutch told Governor George W. Bush and Senators Phil Gramm and Kay Bailey Hutchison (Republican-Texas), the number of installations eliminated in this final round of base closures would be less than originally planned. Although every base was vulnerable, Senator Hutchison believed there was some easing of tensions with this news.

Ann Reese (left), one of the BRAC staff who visited Kelly in April 1995, talks with a worker, while General Curtis listens.

By February peoples' nerves were at a breaking point fueled by endless speculation and suppositions that appeared in the San Antonio newspapers and local TV news broadcasts. Newspapers quoted unnamed sources with military connections in story after story as bits of information leaked out and concern for Kelly workers grew: Kelly was on the list in December but taken off; Brooks AFB, across town from Kelly, would likely be on the list. On February 15, Representatives Henry B. Gonzalez (Democrat-Texas) and Frank Tejeda announced they had received assurances from those in the know that Kelly would not be on the Pentagon's 1995 base closure list. Nevertheless, Tejeda cautioned the commission had until May 17 to add bases to the list, and it had done just that in 1993.

As all of the questions about the future of Kelly and the other depot bases remained unanswered, General Curtis felt that his work force did not need anymore uncertainty. He felt it was essential to provide them timely information from an "official" source, not from the almost daily bombardment of articles in the local newspaper. On February 1, he held a commander's call in building 375, Kelly's huge maintenance hangar, speaking about the center's status and future. Asked to predict Kelly's fate, he told the audience of about 2,500 workers that, "Just like in 1993, I am cautiously optimistic." He went on to say, "You are doing the right things . . . keep making progress and the future will be bright." The important things were their customers, the center's values as an organization, and its people, because the highest rated criteria considered by the BRAC was military value—the value provided to the customers in the field.

On February 28, 1995, the Defense Department released the list of installations it had suggested for closure or realignment. One of San Antonio's five military installations was on the initial list, but it was not Kelly. The Air Force opted to close Brooks AFB, home to AFMC's Human Systems Center and the Armstrong Laboratory. As feared, concerns about the availability of water had factored into the low ranking that Brooks and Kelly received in the Air Force analysis. No air logistics center was on the list. Instead, the Air Force chose to realign and consolidate the Technology Repair Centers in AFMC, proposing to eliminate over 2,000 positions and thousands of square feet across all the ALCs to reduce capacity. The large up-front costs to close a depot were the driving force behind the Air Force decision to downsize all the centers instead of closing one or two.

This, however, did not seem to satisfy BRAC Chairman Alan Dixon, who summoned Defense Secretary William Perry to explain the Pentagon's list the day after it was released. Perry supported the stand of Secretary of the Air Force Sheila Widnall, who took the position that closing a single depot would use up most of the total amount budgeted for the next six years for all Air Force closures and realignments.

Even though the Air Force supported downsizing each of the air logistics centers rather than outright closure, it had begun preparing for the less desirable option. Soon after the DOD list was announced, Pentagon officials released the analysis done in August 1994 by the Air Staff's Base Closure Executive Group that ranked the ALCs. Kelly officials were astounded to find that the San Antonio Air Logistics Center, along with the Sacramento Air

Logistics Center, was ranked at the bottom. Immediate cries of "foul" went up when San Antonio ALC officials examined the analysis. Intense study of the data revealed flawed assumptions and 10-year-old data that if corrected would change San Antonio's ranking. But despite repeated calls, Air Staff minions changed nothing, standing by their analysis and Kelly's low ranking.

All this was closely watched by Utah, Georgia, and Oklahoma lawmakers who saw a chance to capitalize on the misfortune of Kelly and Sacramento. They questioned Air Force logic in downsizing all depots instead of closing one or two. They reasoned that if Kelly and/or Sacramento were to close, the air logistics centers in their respective states would inherit some of the shifted workload. Interestingly enough, the Government Accounting Office (GAO), the investigative arm of Congress, released a report critical of the recommendations DOD sent to the BRAC commission.

On April 17, 1995, armed with the GAO report, BRAC commissioners began grilling Pentagon officials again regarding excess depot capacity and closure costs. Frustrated with the replies, the commission went to the centers themselves to get answers. Five days later, BRAC staffers arrived at Kelly. General Curtis explained Kelly's story, the key role it played in supporting the nation's air arm for 78 years, and fought for downsizing instead of outright closure. Unfortunately, the BRAC commissioners were not satisfied with the Air Force's analysis, voting on May 10 to add the five ALCs, along with 32 other military facilities nationwide, to the list of installations they wanted to review for closure.

Once again the City of San Antonio and Kelly AFB joined forces to save the base, but this year they faced a strenuous, uphill battle. The center formed a task force, made up of people from nearly every directorate, which began assembling answers for questions that seemed to come from every direction—the BRAC commission, the Base Closure Executive Group, members of the U.S. House and Senate, area leaders, and Headquarters AFMC. Task force members worked 10-to-14-hour days in the basement of building 1680, assembling and reviewing data for inclusion in a myriad of briefings and booklets. When the task force requested information from various base organizations, workers responded immediately. Kelly's people were fully aware of their precarious position.

Always aware of the need to keep his workers informed, General Curtis conducted numerous commander's calls around the base.

Following the May 10 announcement by the BRAC commission, Kelly's gate became a revolving door to national, state, and local leaders—all seeking ammunition in their battle to save the center. Intent on keeping the Kelly work force informed, General Curtis held commander's calls around the base. On May 25, he told groups that his briefing to the BRAC would revolve around four basic points: Kelly was more than just a maintenance depot, it was a world-class operation, Kelly's people were its advantage, and Kelly's plans were in place for

downsizing. He told each crowd how much he personally appreciated the effort they all had put forth over the past year to bring about what he saw as a transformation worthy of BRAC consideration.

A bevy of BRAC commissioners arrived in San Antonio the evening of June 5, 1995, instead of just one as in 1993. Members of the city and base task force formed to save Kelly had hoped that around 500 people would greet the commissioners at the San Antonio International Airport. Approximately 2,000 chanting, sign-waving Kelly AFB supporters turned out at the airport to greet the commissioners as they got off their planes. Planners expected the same 20,000 demonstrators to line General Hudnell Drive as they did two years earlier. Instead, the bus carrying the commissioners ran a gauntlet of more than 35,000 blue t-shirt attired, sign-waving Kelly supporters. Banners touted Kelly superiority, and children waved signs pleading with the BRAC commission to save their parents' jobs.

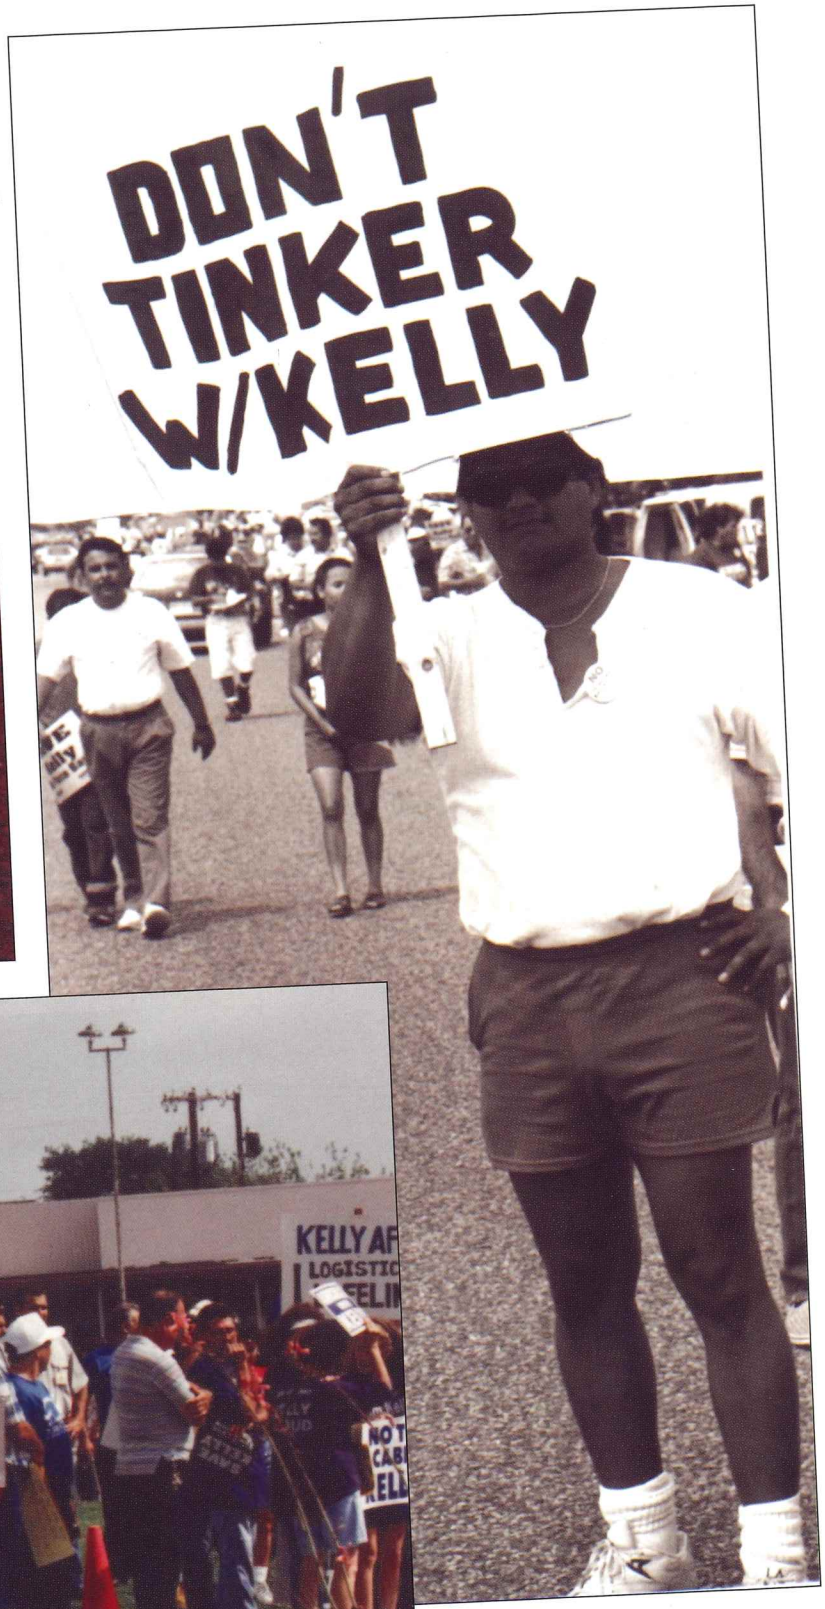

Once again, General Curtis made the case for Kelly, highlighting the strides made in increased productivity, drastically reduced labor problems, and the value of the support the ALC provided the Air Force. But even more importantly, he wanted the commissioners to understand the complexity involved in closing any logistics center—the cost and readiness risks associated with closure and the potential impact on Air Force readiness. Although General Curtis told Kelly's story convincingly, many Kelly officials sitting in the conference room, listening, and watching, believed some of the commissioners had already made up their minds to close at least one logistics center.

Once again BRAC commissioners came to Kelly, but this time the mood was grim.

Among the thousands of Kelly supporters was Senator Kay Bailey Hutchinson (above). At right, boarding the bus for the trip to Ft Worth was Ms Ann Hussey, Chief of the SA-ALC History Office.

At 3 a.m., Saturday, June 10, more than 2,300 Kelly workers and boosters boarded a fleet of 31 buses with plans to pack the auditorium in the Tarrant County Convention Center in Fort Worth for San Antonio's presentation at the regional BRAC hearing. Wearing blue "Kelly Proud" t-shirts, they listened to community speakers correct the flawed data in the Air Force analysis and heard an impassioned plea to spare the Kelly work force and the majority of San Antonio's Hispanic middle class. At the end, Chairman Alan Dixon said, "All of that impresses me, but I hope, and I mean no offense, that when the commissioners vote, they'll vote on facts and evidence." It was hardly a ringing endorsement. Kelly supporters had done all they could. Nothing was left but to wait.

And the wait wasn't long. On the morning of June 22, 1995, BRAC commissioners, in two separate votes of six to two, sent shock waves throughout northern California and southern Texas when they voted to close the Sacramento Air Logistics Center, McClellan AFB, and the San Antonio Air Logistics Center. Rather than closing Kelly AFB, the commission decided to realign that portion of Kelly AFB west of the runway to adjoining Lackland AFB. Brooks AFB was spared.

The BRAC decision may have come as a devastating surprise to most, but senior SA-ALC officials had not placed all their eggs in one basket. A group of senior leaders had been formed nearly six weeks earlier to study the plausibility of privatizing the ALC workload in place—turning military workloads, like the C-5 maintenance work, over to a commercial contractor willing to use Kelly facilities and workers. But most people in San Antonio were stunned by the loss of more than 12,000 jobs and an

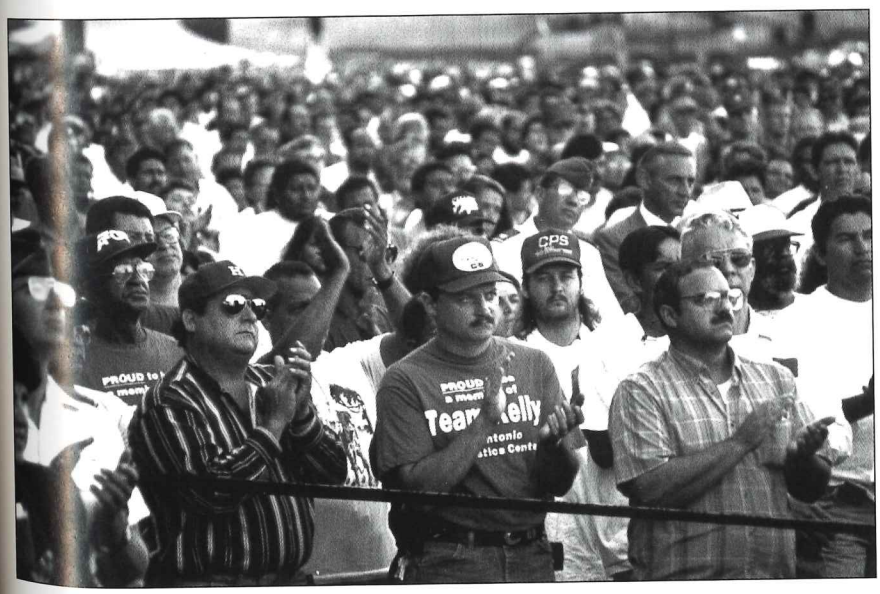

Air Force base that had spurred growth and prosperity for San Antonio and its citizens for almost eight decades. At the base, Kelly workers reacted as if a family member had died, but General Curtis didn't—couldn't—sit still.

Twenty minutes after the BRAC vote, General Curtis was on the phone to sell the idea of privatizing Kelly's workload in place to his counterparts at AFMC and the Pentagon. The concern was that any massive movement of ALC missions would prove too expensive and disruptive to the Air Force mission. Privatization in place was the best option for maintaining Air Force readiness and keeping jobs at Kelly. After concerns about supporting the Air Force, General Curtis viewed losing the work force as his biggest threat after the BRAC decision was made. Sensing the anger, fear, and frustration of his employees, the general called a mass meeting of the Kelly work force in Lindbergh Park. There he addressed some 4,000 members of Team Kelly, explaining that the BRAC decision did not reflect on them or the great San Antonio community. He encouraged everyone by saying, "I never want anyone to point to our performance in the days ahead and say, 'See? We were right.'" Curtis felt that helping the people work through their period of grief, disbelief, frustration, and anger was another important priority; and to do that, he reached out by talking to workers on the shop floors during the weekends and graveyard shifts or in meetings. He related one instance that occurred in one of the aircraft production shops:

Governor Bush talks with machine tool operator Ray Vargas, one of the thousands of Kelly workers concerned about future employment.

> I remember one afternoon talking to some people, and they said, 'Sir, how do you do it? Aren't you mad? I'm so furious. I wake up at night and can't fall asleep. I am so furious about this. Aren't you mad about it?' And I said, 'Look, first, the last thing this world needs right now is for me to be furious and mad . . . me walking around growling and biting people's heads off . . . but the truth is there's too much to do. We have too many things we have to do to preserve Air Force readiness, to support the Air Force, to be mad. We don't have time to be mad.' And it's been really impressive to watch the Kelly workers struggle through all their own feelings and all their own anger and come to the right answer that the real reason we're here is to work Air Force readiness.

Employees at Kelly applaud Senator Kay Bailey Hutchinson

Texas national and state leaders struggled too, trying to adjust to the

proposed loss of the largest employer in south Texas. Senator Kay Bailey Hutchinson and Governor George W. Bush arrived on Monday morning, June 26, to show their continued support to the Kelly work force. But perhaps the most important development was the growing support of an idea the Air Force heretofore had considered anathema—privatization. Many thought that privatization in place was the perfect plan to satisfy the four priorities General Curtis established in the wake of the BRAC decision. The first priority was to continue to provide support to maintain Air Force readiness. The second involved taking care of the Kelly work force. The third aimed at minimizing the impact base closure would have on the San Antonio community. And the fourth priority facilitated turning a "going concern" over to the city in 2001.

On July 13, 1995, President Clinton sent the BRAC list to Congress; but he hoped to soften the blow by delaying the actual closure of the two ALCs for six years—the longest time allowed by law. He also promised that there would be at least 16,000 people holding federal jobs at Kelly through 2001.

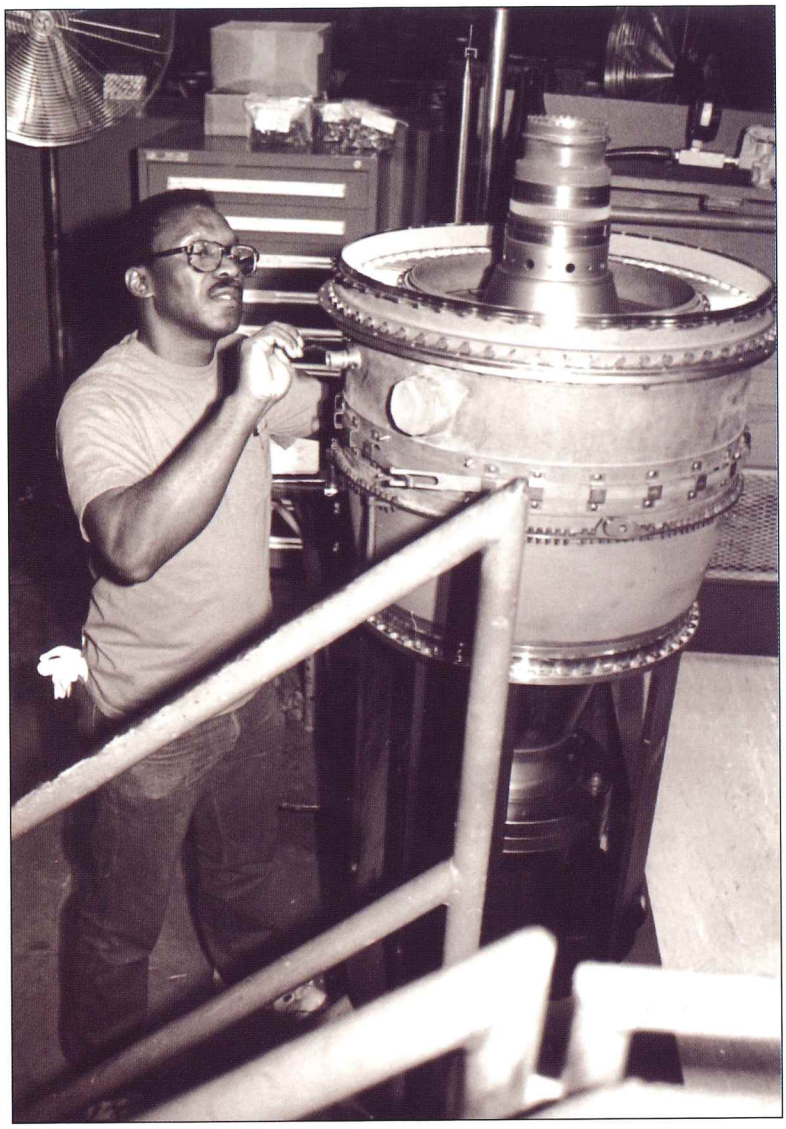

Push to Privatize

"Privatization" meant jobs, but not government jobs. The theory behind the concept was simple: private companies would come to Kelly and do the same work, in the same facilities, using the same work force. That would eliminate the tremendous cost of uprooting a major mission. Privatization in place would minimize the effect Kelly's closure would have on Air Force readiness and mitigate the impact of job losses on the San Antonio community.

Various local dignitaries were on hand to greet Governor George W. Bush when he arrived on the Kelly flight line.

Almost everyone liked the idea—from San Antonio's new mayor, Bill Thornton, to President Clinton. Defense Department officials did their best to take the "sting" out of the BRAC decision by quickly adopting the plan. However, few banked on

Although the Kelly work force reeled from the decision to close the ALC, it did not stop meeting General Curtis' first priority—supporting the Air Force mission.

the strident opposition from members of Congress representing states and districts where other air logistics centers and military depots had survived BRAC cuts.

In August General Curtis chose Tommy Jordan, Director of Contracting, to head up the center's new Directorate of Privatization and Realignment. Kelly's latest organization would serve as the single connection with the city's Initial Base Adjustment Strategy Committee (IBASC) team and later the local redevelopment authority that would devise strategies and plans to redevelop Kelly; contractors interested in privatization; and Air Education and Training Command, the major command under which the realigned and truncated Kelly would fall.

Congress approved the BRAC legislation on September 28, 1995. On July 13, 2001, six years from the date President Clinton sent the recommendation to Congress, the San Antonio Air Logistics Center would be inactivated and Kelly Air Force Base would be realigned as an annex to adjoining Lackland AFB. However, everyone was much too busy to do more than pause for a second before going back to work.

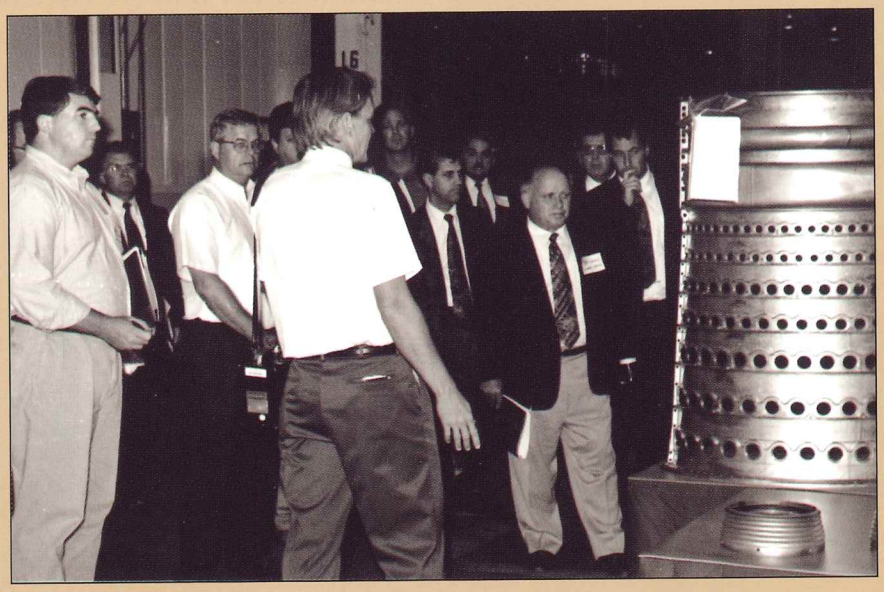

Privatization

During the summer of 1995, SA-ALC officials thought out the principles they intended to follow in this early stage of planning. Their goal was to provide an environment attractive to contractors who would use the Kelly industrial capability and work force on a long-term basis to protect Air Force readiness and expand the business base. Center managers broke the depot workload into four business areas: scheduled maintenance, planned upgrades and retrofits, painting, and software support for the C-5 transport; analytical condition inspections and software support for the C-17; two-level maintenance, component repair, and complete overhauls for F100, TF39, and T56 engines, small gas turbine engines, secondary power systems support and fuel accessories in the Propulsion Business Area; and support for automatic test systems, electronic engine controls, and software in the Kelly Electronics Business Area. Ultimately, the San Antonio Air Logistics Center would compete only the C-5 and Propulsion Business Area workloads.

Things continued to happen at a fast and furious pace. On October 14 and 15, the San Antonio Air Logistics Center hosted its first Industry Days, a brainchild of Mr. Jordan's, both to gauge the interest of private industry in competing for the center's

workload and to open a forum to answer—and ask—questions. Over 500 people representing some 200 companies came to Kelly for Industry Days. Just two days later, on October 17, President Clinton made his first tour of Kelly. Speaking before a crowd of more than 2,000 Kelly workers, he pledged the support of his administration to the privatization plan. The AFMC site survey team came to Kelly later in October to begin the huge task of deciding which facilities to retain and which to declare surplus as well as determining where to draw the fence line for realigned Kelly.

INDUSTRY DAYS

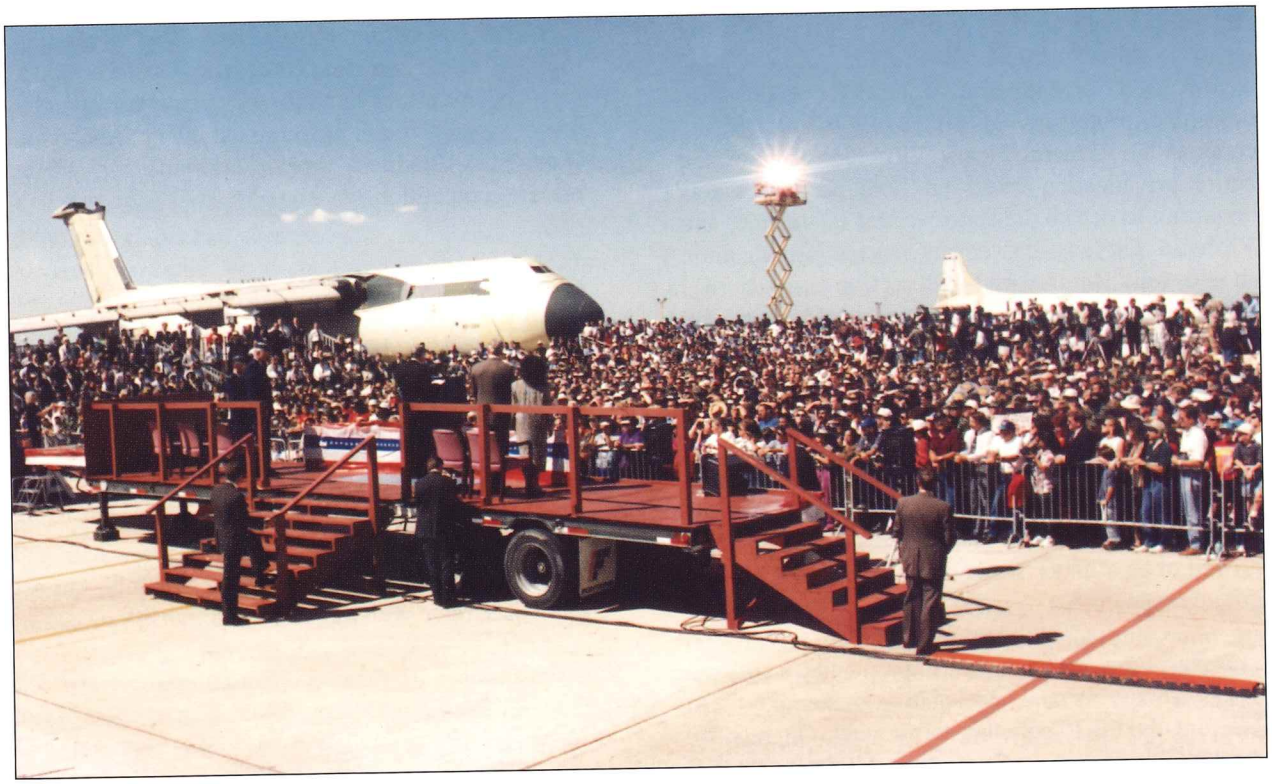

The job facing Kelly personnel over the next six years was incredible. No one had ever tried closing an organization as large and complex as the San Antonio Air Logistics Center. While AFMC officials supported the ALC's desire to move privatization as quickly as possible, they were somewhat less inclined to put complete business areas on the table all at once. Instead, AFMC directed Kelly to try smaller "prototypes." As a result, the San Antonio ALC chose to privatize two workloads that were part of larger business areas by the end of FY96—the C-5 Aircraft Directorate's aircraft paint and depaint workload and the fuel accessories workload in the Aerospace Equipment Management Directorate. Determining the hows would occupy some of the best minds of the center for months to come.

Center officials determined the C-5 paint-depaint operation would be considered first. The goal

In October 1995, President Clinton visited Kelly AFB accompanied by former San Antonio mayor Henry Cisneros. Hundreds of people came to hear what the President had to say about privatization.

From left, Mayor Thornton, President Clinton, General Curtis, and General Viccellio met in October 1995 to discuss privatizing the Kelly workload.

was to award this contract by December 1996, the same target date for the much larger fuel accessories repair workload. Officials at the San Antonio ALC were ready to issue the draft requests for proposal for their two prototypes in March 1996, but AFMC commander, General Henry Viccellio, Jr., put the entire privatization effort on hold. Congress was preparing to debate the controversial 60-40 rule, and Viccellio felt any movement toward privatization should wait. In the mid-1980s, Congress decreed that the Department of Defense would spend 60 percent of its depot maintenance budget in military facilities. The remaining 40 percent could be contracted out to private industry. Many in Congress, particularly those allied with the Depot Caucus, were reluctant to change that rule, something that had to be changed if all of the depot maintenance workloads at Kelly and McClellan were to be contracted. This proved to be a major stumbling block on the road to privatization.

During the summer, various members of the Texas congressional delegation attempted to overturn the 60-40 rule, but to no avail. On July 30, the House and Senate Conference Committee voted to keep the 60-40 rule intact for FY97. The Texas delegation vowed to try again the following year, but the die had been cast. The San Antonio ALC scrapped its initial attempts to pursue privatization prototypes and began blocking out the entire C-5 and Propulsion Business Area workloads for public/private competition.

C-5 Competition

On August 16, 1996, General Childress officially announced the new plans for competition of the SA-ALC depot workload, starting with the C-5 depot maintenance operation, a workload performed by about 1,200 people and worth $150 million a year. The competition would begin in October 1996, with the release of the draft request for proposal, and contract award was scheduled in the July-August 1997 timeframe with a nine-month transition.

On October 10, the C-5 directorate hosted Darleen Druyun, Principal Deputy Assistant Secretary of the Air Force for Acquisition and Management, and senior leaders from the Air Staff and Headquarters

AFMC. This group made up the C-5 Pre-Acquisition Strategy Panel (ASP), which met to develop the strategy for competing the workload. The ASP's primary function was to ensure the playing field was level for both public and private bidders. Beginning October 21, Ms Druyun hosted a meeting of the ASP in Washington. The meeting concluded with approval of the release of the draft request for proposal. On November 12, the center's Contracting Directorate released the C-5 Business Area draft RFP. It published the final version on February 11, 1997.

In August 1996, General Childress announced the decision to compete the entire C-5 workload.

As early as September 1996, Kelly's Civilian Personnel Office began working a mock reduction-in-force (RIF) to identify positions to be abolished upon completion of the C-5 competition. Those workers affected by the RIF would be eligible for separation with Voluntary Early Retirement Authority (VERA) or the Voluntary Separation Incentive Program (VSIP). Employees also had access to several placement programs, including the Priority Placement Program (PPP).

On November 21 and 22, nearly 1,500 workers (1,200 in the C-5 directorate and 300 in other organizations) received letters informing them of the opportunity for early PPP registration. Kelly officials gave workers a 16-month head start, rather than the normal 120-day notice, to think about future options. As General James S. Childress stated, "I want to make one thing clear: these are reduction in force notices, not pink slips—only an opportunity for people to enter into the voluntary priority placement program." Of the 1,500 workers eligible, 945 registered early in the Priority Placement Program. Another 900 turned in applications for the VSIP and VERA incentive programs.

It was up to officials at Headquarters AFMC to decide which air logistics center would compete for the C-5 workload. Command leaders soon announced that the Warner Robins ALC at Robins AFB, Georgia, would be the public competitor. Lockheed Martin Corporation, manufacturer of the C-5; McDonnell Douglas, soon to be purchased by Boeing Corporation; and Aero Corp S.A., a local subsidiary of the Dallas-based Whitehall Corporation, represented private industry.

Relieving the minds of many Kelly workers, all of the private bidders announced that airframe and power plant (A&P) certification would not necessarily be a prerequisite for employment. However, those with airframe and power plant certificates would be at a greater advantage.

General Childress tells maintenance workers that the Warner Robins ALC won the C-5 maintenance competition.

More than two years of uncertainty about the future of the C-5 program at Kelly came to an end on September 4, 1997, when Air Force Secretary Sheila Widnall announced that the Warner Robins Air Logistics Center had won the C-5 depot maintenance contract. The decision was a blow to those who had hoped a private sector bidder would prevail and keep the C-5 maintenance work at Kelly, taking advantage of a trained work force already in place and facilities superior to all others. In crafting its bid, the Warner Robins team "thought out of the box," winning a contract worth more than $434 million over seven years. The Warner Robins' bid predicted a $190 million savings over the life of the contract, providing the best value to the government. The city of Macon, Georgia, celebrated, while San Antonio sighed. Commercialization replaced privatization as the favored buzzword.

Even more stunning was the speed with which Warner Robins proposed taking over the C-5 workload. The Georgia team wanted to establish an operating location (OL) at SA-ALC, take over responsibility for programmed depot maintenance, and assume work in progress—all within 60 days. And the team did just that. On November 3, Warner Robins established the OL at Kelly with 170 or so people from the SA-ALC who had volunteered to transfer to Georgia. The SA-ALC loaned another 50 people to the OL to finish those aircraft still going through the PDM process. The first C-5 Speedline aircraft arrived at Robins AFB on October 8, followed by the first PDM aircraft on January 6, 1998. Warner Robins managers estimated that workers would reach full production rate by May 1998, and the last C-5 would leave Kelly the following July. The C-5, which had been synonymous with the San Antonio depot for over 30 years, would be a thing of the past at the SA-ALC in less than a year.

Within a week of the award, representatives from the Warner Robins ALC and communities surrounding Macon arrived at Kelly to lay transitional groundwork and tout the advantages of life in central Georgia. Managers from the Warner Robins ALC accepted and screened applications from C-5 personnel seeking to follow their jobs to Georgia. Looking

for a quick and seamless transition of the C-5 workload from Texas to Georgia, another group sat up a transitional OL at Kelly to allow workers from Georgia to learn C-5 production from people who had performed it, some for a quarter of a century. Most of the Kelly personnel serving in the operating location were those who had volunteered to go to Georgia. Robins managers hoped for a massive turnout of Kelly workers willing to follow the C-5 to Georgia. They were disappointed. Of approximately 1,200 Kelly workers eligible to follow their jobs to Robins, only 169 opted to move. Despite numerous incentive packages involving education grants, house-hunting, and spousal employment assistance, the Warner Robins ALC came up with only 22.5 percent of the personnel it needed.

Colonel Peter Hennessey had started planning the C-5 competition while he was the C-5 aircraft system program manager. Colonel Terry Gabreski, his replacement as C-5 aircraft director, provided oversight for the transition. One of the most important things to come out of this planning was the idea of the transition handbook. When Warner Robins personnel first arrived at Kelly, C-5 managers handed out transition notebooks with checklists that detailed what had to be done to make the transition work. These handbooks were just one of the many things directorate personnel did to ensure there would be as little disruption as possible for their C-5 customers.

On November 24, 1997, some 1,000 C-5 maintenance workers began receiving RIF notices, an action which took effect March 31, 1998. However, cuts were not as painful as first envisioned—approximately 600 moved to jobs in other directorates at the same grade; nearly 350 went to other jobs, but at lower grades; and only 3 permanent employees were separated from federal service.

Military units were also caught by the decision to award the C-5 workload contract to the Warner Robins ALC. Air Mobility Command established Detachment 1 of the 60th Logistics Group at Kelly AFB on November 15, 1993, to conduct non-PDM inspections and repairs. After performing its mission brilliantly for almost five years, Air Mobility Command inactivated the detachment on May 1, 1998. Another Kelly unit affected was the 313th Flight Test Squadron. Besides performing all the inspection flights on the C-5 after programmed depot maintenance, the squadron also participated in various tests and evaluations of new

A crew member waves from the top of the last C-5 at the San Antonio Air Logistics Center.

systems installed on aircraft for which the San Antonio Air Logistics Center had system management responsibility. Flight test operations had taken place at Kelly since 1917. The 2873d Test Squadron, activated on January 15, 1988, was the last unit at Kelly to perform this mission. The squadron was redesignated as the 313th Test Squadron on October 1, 1992, then as the 313th Flight Test Squadron on April 1, 1994. Crews from the 313th flew all the final check flights and picked up and delivered C-5s as the workload at Kelly permitted. Its pilots and flight engineers also trained the new C-5 aircrew members from the 339th Flight Test Squadron at the Warner Robins Air Logistics Center. On May 29, 1998, AFMC inactivated the 313th Flight Test Squadron, ending an eight-decade mission of flight testing aircraft repaired at Kelly.

On November 20, 1997, the last C-5 to undergo programmed depot maintenance at Kelly landed. As the work in progress gradually wound down, the C-5s at Kelly dropped from a high of 14 aircraft on station in November 1997 to 8 in March 1998 and 3 aircraft in June. As the numbers fell at Kelly, the number of aircraft on station at Robins rose, topping off at 11 of the giant Galaxies by June. Production in the final months proved the most difficult as the centers strove to stretch resources and efforts between two locations. By mid-May, work on the last PDM aircraft at Kelly fell behind as workers discovered significant structural problems in this aircraft. Nevertheless, on September 15, 1998, the last C-5 Galaxy sent to the San Antonio Air Logistics Center for programmed depot maintenance, tail number 69-008, departed Kelly AFB, marking the end of almost 80 years of depot maintenance on military aircraft.

Propulsion Business Area Competition

As challenging as the C-5 competition had been, many officials at the San Antonio Air Logistics Center viewed it as practice for the larger and more complex Propulsion Business Area (PBA) competition. As initially conceived, the Propulsion Business Area consisted of overhaul, modification, and repair of F100, TF39, and T56 engines; fuel accessories; two levels of maintenance for TF39 and T56 engines; and repair of gas turbine engines, secondary power systems, and jet fuel starters. Although not all engines per se, the workloads were similar and required common skills, processes, and facilities. They also shared customer and supplier relationships.

The last C-5 Galaxy sent to Kelly for PDM departed the base on September 15, 1998.

Thousands of tons of equipment for the C-5 workload moved from Kelly to Robins.

With input from private contractors most likely to submit a proposal for the competition, the Propulsion Directorate's team devised an interesting approach to this acquisition, wanting to use Federal Acquisition Regulation Part 12 (Acquisition of Commercial Items) to develop a long-term, "commercial-like" solicitation.

Discussions between Headquarters AFMC and the San Antonio ALC over which workloads to include in the Propulsion Business Area competition continued. Ultimately, everything but basic engine workload was stripped from the package.

The command decided the entire gas turbine engine depot maintenance workload, including secondary power systems and air turbine starters, would transfer to the Ogden Air Logistics Center at Hill AFB, Utah. By the time the San Antonio Air Logistics Center hosted the Propulsion Business Area pre-acquisition strategy panel on February 13, 1997, the competition program consisted of overhaul, repair, and modification of engines (the F100 series, TF39, and T56 series including the Navy workload), fuel accessories, and engine specific electronic components. Additionally, it included TF39 and T56 two-level maintenance.

It was common knowledge within Air Force Materiel Command that the Oklahoma City Air Logistics Center, as the only other engine depot in the command, would be the public bidder for the PBA workload at San Antonio. However, officials in AFMC did not make their decision public until late February 1997.

On August 6, 1997, one milestone for the Propulsion Business Area competition was reached when the Defense Depot Maintenance Council made the CORE determination on the engine workload at the San Antonio Air Logistics Center. Kelly's depot workload had to be found non-CORE to be eligible for competition.

While the explanation had changed over time, the current definition stated that "DOD will retain a limited organic CORE depot level maintenance and repair capability to . . . meet essential wartime surge demands, promote competition, and sustain instructional expertise." What this meant was that 50 percent of the F100 whole-up engine workload and 24 percent of the F100 modules (some 140,500 hours of work) should be treated as CORE and moved to the Oklahoma City Air Logistics Center. The remaining engine workload could be competed.

Contracting goes high tech at Kelly. At center, Gloria Garcia, the contracting officer, explains the system.

On January 16, 1998, the Contracting Directorate at the San Antonio ALC released the draft RFP for the PBA competition, and it sent out the final RFP on March 30. The Oklahoma City ALC, on April 27, announced it would partner with Lockheed Martin to submit a joint bid for the PBA contract. Political grandstanding, a General Accounting Office report criticizing the approach the San Antonio ALC took in its solicitation, and official protests complicated, but did not stop, the competition.

A former Kelly employee waits for machinery and accessories to arrive at the Oklahoma City Air Logistics Center on Tinker AFB.

On January 16, 1999, two groups of bidders submitted their best and final offers. Pratt & Whitney San Antonio Engine Services Corporation (with its subcontractors General Electric Company, Allison/Rolls Royce/Standard Aero, Allied Signal, and Caterpillar Logistics) turned in a bid, as did the Oklahoma City ALC with its partner, Lockheed Martin Kelly Aviation Company. Lockheed Martin, in turn, had teamed with Standard Aero Limited, Chromalloy Gas Turbine Corporation, and Woodward Governor.

On February 12, 1999, Darleen Druyun once again reported that the public bidder, Oklahoma City ALC, and its commercial partner, Lockheed Martin, had won the Propulsion Business Area competition. At $10.164 billion, it was the largest

On August 27, 1999, Kelly workers finished the last whole-up F100 engine overhaul.

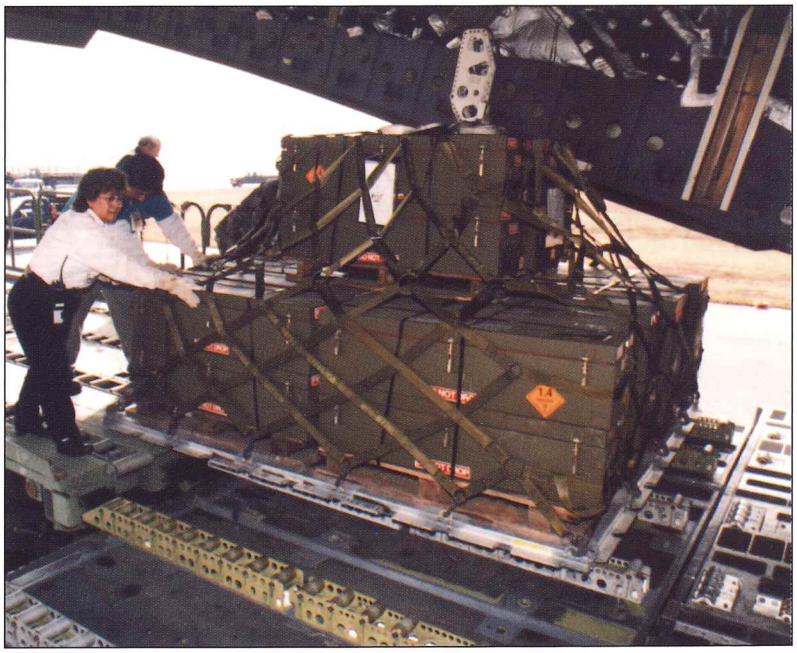

Overhaul and two level maintenance on the TF39 engine remained at Kelly.

single repair and overhaul contract in Air Force history. Pentagon officials estimated a $1.8 billion savings over the 15-year life of the contract. However, the news was not all bad for Kelly. Oklahoma City stated early on that it was only interested in the F100 engine and fuel accessories workload, which equaled about 40 percent of the contract price. That was where Lockheed Martin and its subcontractors came into play. It assumed responsibility for the remaining portion of the PBA workload, including TF39 and T56 engine maintenance. That work, worth 60 percent of the contract price, would remain at Kelly in building 360, which Lockheed Martin would lease from the GKDC.

Officials at the two ALCs envisioned a "hot turnover" of PBA work, that is the San Antonio ALC would turn over an ongoing engine and accessory engine program while transferring workload, personal property, materiel, and personnel. Support for the engines would not stop during the transition. This was especially evident during the inventory of PBA personal property between March 24 and April 29, 1999. Over 100 people inventoried approximately 40 buildings and recorded over 100,000 items to determine every single item associated with the F100 and accessory workload going to Tinker and the government furnished equipment that Lockheed Martin would need to perform the TF39 and T56 workload, as well as personal property going to GKDC. This was truly an astonishing feat given that the inventory could not interfere with ongoing production or the surge effort to support the flying mission during the crisis in the Balkans over Kosovo.

Oklahoma City's transition plan called for Kelly to continue its engine workload for 120 days after the award of the contract. On June 14, 1999 (the 120th day), Oklahoma City ALC stood up an OL at Kelly and accepted primary responsibility for all F100, TF39, T56 maintenance. A phased transfer over a designated period of time allowed Oklahoma City to move tooling and material to Tinker AFB and for SA-ALC engine mechanics to complete all

In the midst of turning the engine workload over to Tinker, Kelly workers found themselves supporting the U.S. effort to halt Serbian ethnic cleansing in Kosovo.

Lockheed Martin workers continued performing engine repair and overhaul in Kelly's engine repair facility.

work in progress. In doing this, Kelly reached a milestone on August 27, 1999, when Fighter Propulsion Division workers completed the last "whole up" F100 engine overhauled at Kelly. Acceptance of engine serial number PWOE681126 marked the end of an era that began in building 360 some 26 years earlier when the first F100 engine arrived in 1973 for unscheduled maintenance. Approximately 1,500 PBA positions transferred to the Oklahoma City ALC. All together, Tinker brought on about 1,150 people to do the workload; 370 of those came from San Antonio.

On March 16, 2000, AFMC Commander General George T. Babbitt presented Vice President Al Gore's Hammer Award to the SA-ALC Propulsion Business Area source selection team. The award, which came with a $6 hammer, a ribbon, and a thank you letter from the vice president, recognized teams of federal employees whose work resulted in a government that "works better and costs less." It was a deserving tribute to the PBA team who had overcome seemingly insurmountable political obstacles and complex acquisition challenges. Their work had resulted in a $10.1 billion contract that would save the government $1.8 billion over the next 15 years.

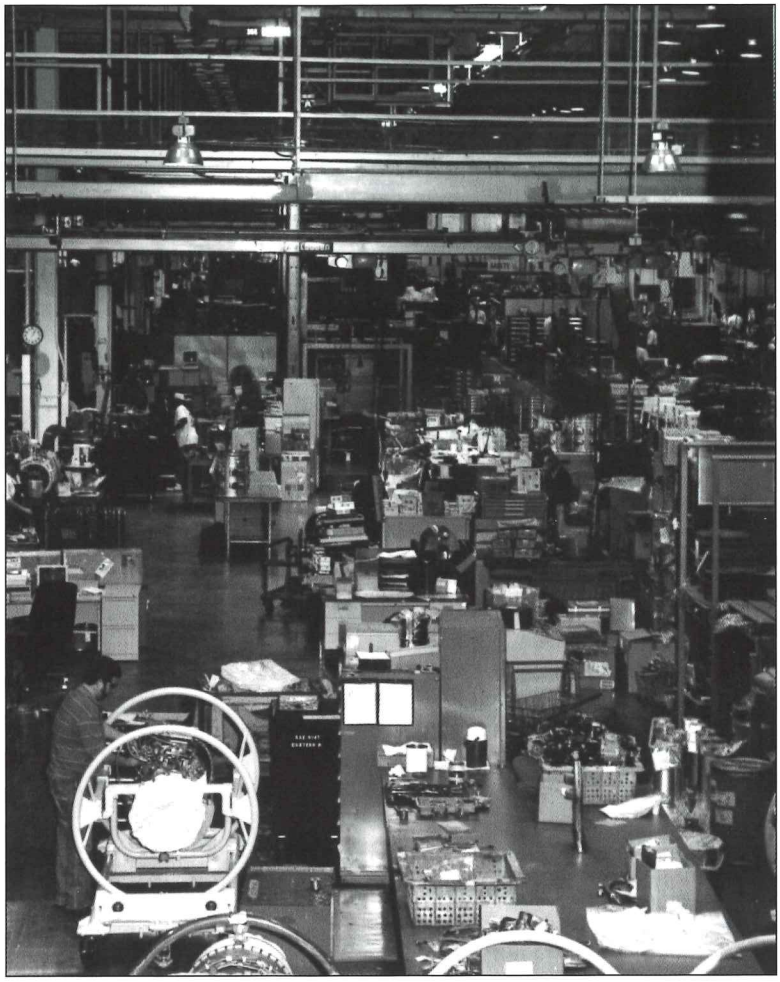

In August 1999, Lockheed Martin signed a seven-year lease with GKDC for nearly one million square feet in building 360. In addition to the jet engine repair facility, nine other buildings and portions of four others were included in the agreement. One of the successes of the Kelly transition was Lockheed Martin's construction of a new plating shop. Only 14 weeks elapsed from the time the first soil samples

Lockheed Martin signed a lease with GKDC to use building 360.

were taken until the construction of the new facility was complete. On December 14, 1999, Lockheed Martin assumed full control of the TF39 and T56 contract workload. A group of former SA-ALC employees cut a blue ribbon at door one of building 360, officially opening the Kelly Aviation Center. By this time, Lockheed Martin had hired more than 800 employees from the Kelly work force, bringing its total employees to about 1,260. The company expected another 125-150 jobs to be created on Kelly property by subcontract work.

The Oklahoma City ALC reached full production capability for the F100 as scheduled on January 25, 2000. The final PBA workload to transfer to Tinker AFB was that for fuel and airframe accessories. Oklahoma City ALC workers reached full production of these items on January 12, 2001, successfully ending the largest, most diverse, most complex undertaking in the history of Air Force logistics.

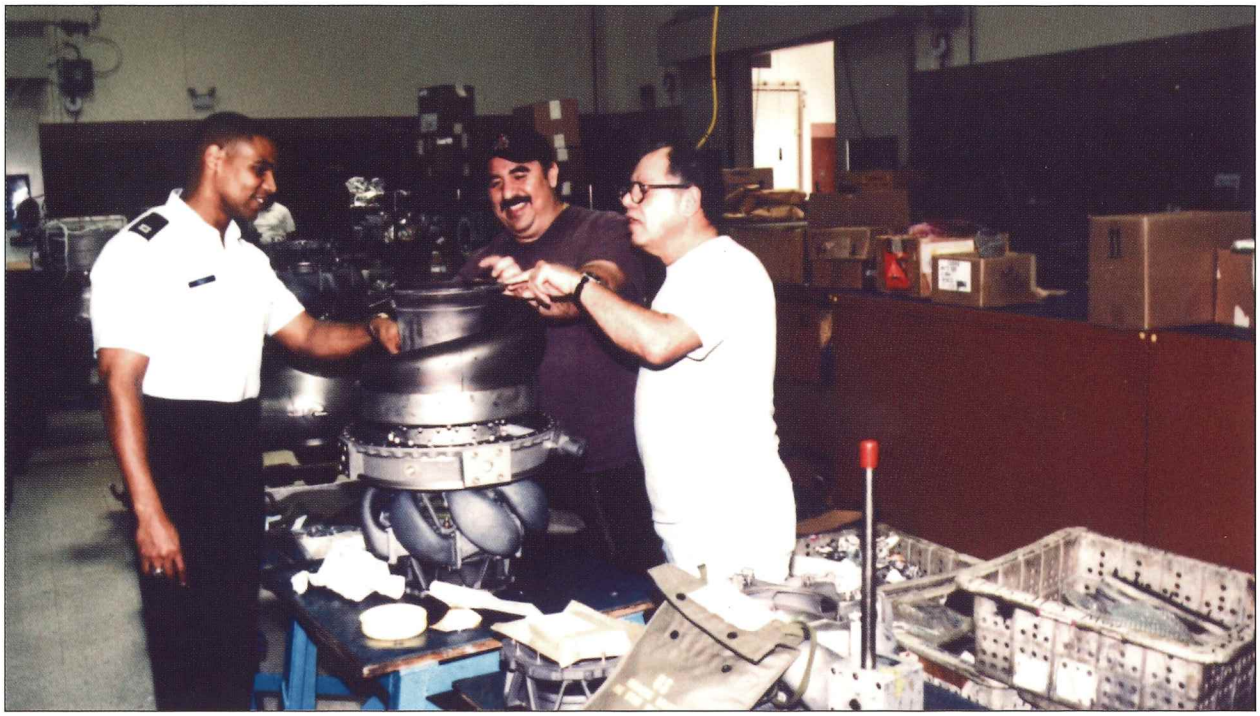

The T56 engine final assembly area for Air Force and Navy engines was located in building 360, part of the Propulsion Business Area.

Other Depot Maintenance Moves

Early in the post-BRAC planning process, SA-ALC officials configured Kelly's depot maintenance workload into business areas, grouping each of the areas around homogenity of technical skills. Ultimately, only C-5 depot maintenance and the propulsion business area went out for public/private competition. AFMC shifted the remaining depot workloads to the other ALCs. Oklahoma City received the F100 CORE workload, Ogden ALC gained gas turbine engine and secondary power systems, and Kelly's electronics and automatic test equipment workload moved to Warner Robins ALC.

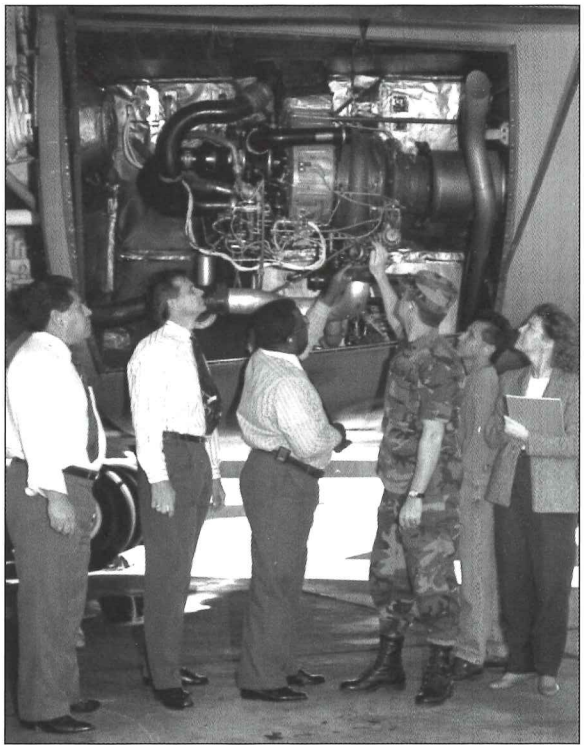

As July 13, 2001 came closer, Kelly began seeing its seven decades of depot maintenance come to an end: the final C-5 to undergo programmed depot maintenance departed on September 15, 1998; and the last F100 engine overhauled in building 360 left on August 27, 1999. Transition of Kelly's electronic business area, which included repair of automatic test equipment; avionics; general purpose equipment; and software maintenance, development, and repair, began in October 1998 and progressed on schedule through May 1999. On June 1, 1999, the centers declared the realignment complete. All electronics and automatic test equipment work and assets had transferred to Robins, including personnel relocations, authorizations, and fiscal authority. By October 1999, only the Aerospace Equipment Management Directorate's Power Systems Division, supported by the Technology and Industrial Support Directorate, was performing government maintenance operations for the ALC. On April 28, 2000, division personnel completed repair work on their final items: a gas turbine engine, an F-15 central gear box, and an F-15 aircraft-mounted accessory drive. With the last of the work completed, the remaining Ogden OL work force began moving to Hill AFB in May to join those who left earlier. It was the end of almost 80 years of depot maintenance at Kelly AFB—a true end of an era.

Captain Dave Coley, branch chief for Secondary Power System Gas Turbine Engines, Air Turbine Starts and Aircraft Accessories, checks out the final assembly of a gas turbine engine with mechanics Raul Belton (center) and Felix Cedillo.

These boxes of equipment were destined for the Oklahoma City ALC.

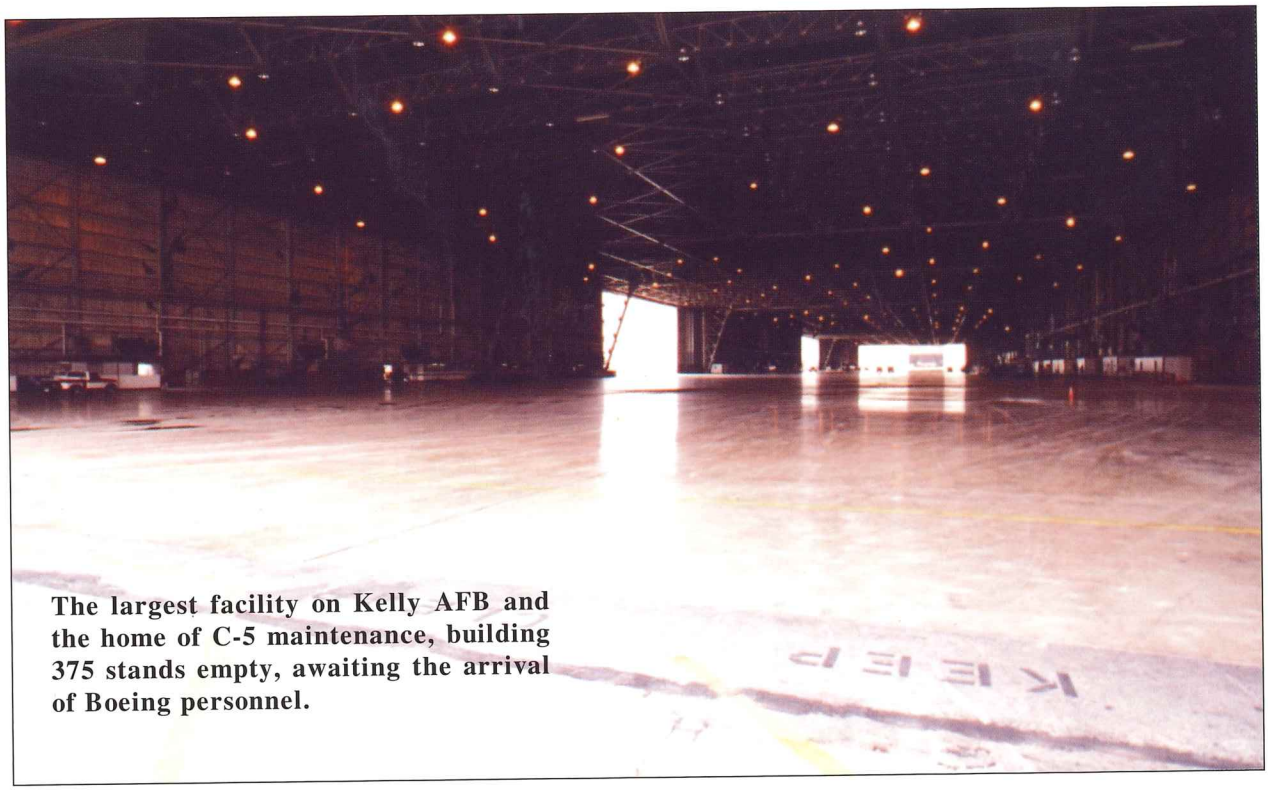

The APU team looks at some of the secondary power source system equipment moving to Ogden AFB in Utah.

Materiel Management Realignments

Although SA-ALC officials initially looked at the idea of privatizing materiel management functions as well as the depot workloads, their counterparts at Headquarters AFMC quickly put an end to that idea. Senior leaders wrestled with the issue of where to relocate the various management functions of San Antonio and Sacramento in the fall of 1995, and by early 1996, they had made most of the decisions. The Mature Aircraft System Program Director (SPD) at the San Antonio ALC would move to the Ogden ALC at Hill AFB. The C-5 SPD would transfer to Warner Robins ALC in Georgia, as would the C-17 System Support Manager. The Ground Support Equipment Materiel Group Manager and the Automatic Test Systems Product Group Manager (PGM) would merge into Warner Robins' new Support System PGM. Management of engines and engine accessories, along with the Propulsion PGM, would move to the Oklahoma City ALC. Kelly's Nuclear Weapons workload would be divided between the three remaining ALCs and Kirtland AFB, New Mexico. Warhead management moved to Kirtland. Officials at the San Antonio ALC opted to move materiel management functions relatively late in the realignment time line, primarily to keep the expertise at Kelly during the competitions.

To facilitate the complex program ahead of them, center officials looked at establishing operating locations to assist the moves and protect employees from future reductions-in-force. Using OLs offered a better opportunity to maintain experienced personnel and skills while allowing the gaining ALCs to see how many vacancies they would have to fill. Personnel actions would realign all functional volunteers into an OL and staff any vacancies with others who qualified for the positions and who were interested in relocating. Employees from other directorates could use the time prior to the final move to learn their new jobs.

The largest facility on Kelly AFB and the home of C-5 maintenance, building 375 stands empty, awaiting the arrival of Boeing personnel.

C-5 Aircraft Management Directorate

The decision to award the C-5 depot maintenance contract to Warner Robins late in FY97 led to the decision early in FY98 to move up the C-5 SPD realignment to Warner Robins ALC from the fourth quarter of FY01 to the third quarter of FY99. In May 1998, Warner Robins established its second OL at

On February 28, 1998, the GKDC signed a letter of intent with Boeing. Senator Kay Bailey Hutchison was among the guests at the signing.

Amid much pomp and circumstance, GKDC and Boeing signed the lease for building 375.

At top, Governor Bush was on hand when Boeing signed the lease. (Bottom) By the fall of 1998, building 375 was no longer empty. Boeing had brought in KC-10s, KC-135s, and C-17s for Kelly workers to repair and modify.

Kelly, this time for the materiel managers. The creation and subsequent deployment of an SA-ALC advance team to Robins AFB on August 31 followed. Warner Robins' OL preserved the "business capability" by retaining expertise at Kelly, while the advance team began the job of establishing an infrastructure of support in Georgia.

Instead of employees from the San Antonio ALC at work in building 375, this photo shows Boeing crews working on Air Force aircraft.

Over the next eight months, some 2,721 national stock number items transferred to Robins. By the end of January 1999, over 75 percent of the C-5 SPD office had moved to the Warner Robins ALC. On March 31, 1999, SA-ALC's C-5 Aircraft Management Directorate was disestablished, and SPD responsibilities transferred to Warner Robins the next day, followed by the transfer of designated acquisition commander authority from the SA-ALC commander to his counterpart at Warner Robins. On May 28, 1999, the C-5 SPD office in building 375 at Kelly closed for business, and a message on its answering machine referred customers to the new C-5 directorate at the Warner Robins ALC. The remaining C-5 directorate personnel completed their final tasks to close operations at Kelly by the end of June 1999, when their positions officially ended.

Propulsion Product Group Manager

When AFMC first created the Propulsion Product Group Manager in 1993, both the San Antonio and the Oklahoma City ALC's, the Air Force's two engine depots, sought to be selected as its home. Command officials assigned the new organization to Kelly, but the BRAC decision to close the San Antonio Air Logistics Center meant its sister ALC in Oklahoma City would get its chance next.

Originally, plans called for the office to move to Tinker AFB between January and March 2001; but as they often do, the plans changed. An overall successful transition of the F100 workload to Tinker and what essentially became a "job swap" between Propulsion Group Manager Robert J. May, Jr. and Air Force Research Laboratory Executive Director Timothy L. Dues precipitated the early relocation of the office in May 2000.

Propulsion Management Directorate

Kelly's Propulsion Management Directorate planned the transition of its materiel management responsibilities to Tinker to take place over three phases. The first involved movement of equipment and an advanced team in March 2000, followed by the transition of F100 management and support beginning in June. The final phase began in October 2000, focusing on TF39 and T56 management and support. That point marked the peak in actual movement of personnel and personal property. In the middle of this, responsibility for the propulsion designated acquisition commander transferred from the San Antonio ALC to the Oklahoma City ALC on July 21, 2000. Final material management supply responsibility ended at Kelly in February 2001, and the propulsion directorate closed on April 1, 2001.

C-17 System Support Manager

On December 1, 1997, the Air Force signed an initial flexible sustainment contract with Boeing Corporation, manufacturer of the C-17 Globemaster III. This contract, which took effect on January 1,

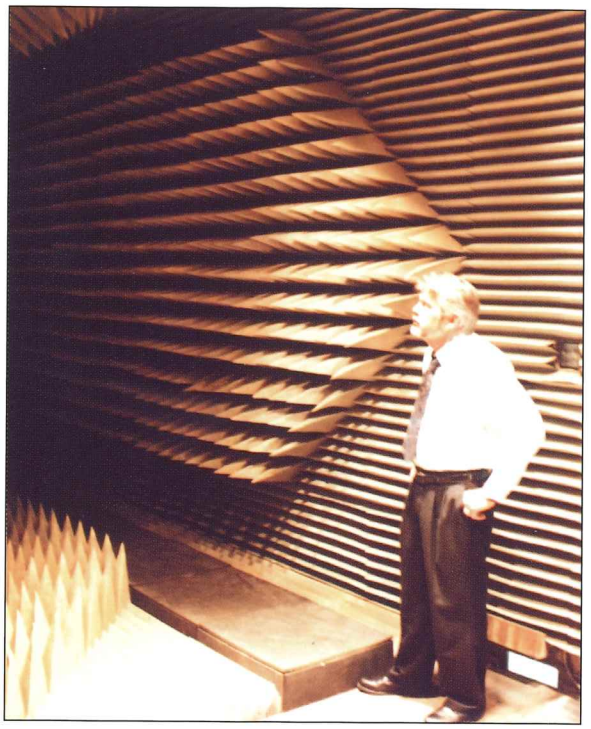

1998, was an innovative support concept that combined elements of contractor logistics support (for the engine), interim contractor support (for supply and maintenance activities), and potential public/private partnering with the air logistics centers and/or government furnished services initiatives into a single, performance-based contract executed by the program management office at Aeronautical Systems Center (ASC) at Wright-Patterson AFB, Ohio, and the C-17 System Support Manager at the San Antonio Air Logistics Center. Once signed, a dispute arose over a proposal to move the SA-ALC office to ASC, not Warner Robins as originally planned. Both of the ALCs opposed this idea and beat it down not once, but twice: the first time in the summer of 1998 and again a year later. The original decision stood, and preparations to move the C-17 office continued. Robins had already established an operating location for the C-17 at Kelly in February 1999, followed by the first move of equipment to Georgia in September to prepare for the arrival of the C-17 advance team. The team's departure marked the true start of the C-17 transition. Most of the movement of personnel, systems, and resources took place between January and September 2000. The C-17 office officially moved to Robins AFB in July 2000 with the arrival of the system support manager, and Kelly's C-17 Aircraft/Systems Support Management Directorate closed on September 23, 2000.

Mature and Proven Aircraft Management

On October 1, 1996, in preparation to gain SA-ALC's mature and proven aircraft workload and

Maintenance workers employed by Boeing stand in front of the first C-17 that went through modification at Boeing's facility at Kelly.

To perform its mission to repair various equipment items, the Directorate of Nuclear Weapons had to use a wide variety of one-of-a-kind facilities.

Sacramento ALC's A-10 and F-111 mission, Ogden ALC established the Provisional Mature/Proven Aircraft System Management Organization to serve as a single point of contact for all matters relating to the consolidation of the two workloads. Initially, center managers planned that Kelly would shift its people and responsibilities to Hill between October 2000 and May 2001, but a projected shortfall in FY99 funding compelled the San Antonio ALC to compress and advance its plans. An advance team arrived at the Ogden ALC on April 10, 2000, followed by the rest of the transferring workforce on July 17-31, 2000. The final contingent of people arrived at Hill toward the end of September. Designated acquisition commander authority shifted to Ogden on August 1, 2000; and Kelly's Mature Aircraft Management Directorate closed on August 31, 2000.

Nuclear Weapons Directorate

Since 1952 Kelly had been host to the Nuclear Weapons Directorate, whose mission it was to provide worldwide logistics management of the Air Force nuclear ordnance program. Its

Moving the Directorate of Nuclear Weapons was a real challenge. Workers had to pack up and carefully transfer 1960s-era test equipment.

personnel provided key support in the areas of engineering, item management, testing and repair, and material storage and distribution to field units. However, with the decision to close the ALC, employees knew that their maintenance and management workloads would move, but the question was where. In 1997 AFMC announced that the Nuclear Weapons Center of Excellence, including the bomb and warhead aspects of its business, would relocate to Kirtland AFB, New Mexico; reentry vehicle maintenance and management would integrate with the intercontinental ballistic missile organization at the Ogden ALC; and the bomber/cruise missile nuclear-related workload would move to the Oklahoma City ALC. In all, about 187 workers moved between August 1997 and September 2000.

The first to move was that workload scheduled to go to Hill AFB. About 110 authorizations and 6,000 line items transferred between August 1997 and March 1999. Forty-four people opted to move with their jobs. The first three people in the reentry vehicle production division for the Minuteman III and Peacekeeper missiles reported to work at Hill on August 8, 1997, with the final group reporting in March 1999. Warehouse inventory assets associated with this workload arrived at the Ogden ALC in phases with the last group of items arriving in April 1999. Moving these assets, about 6,000 different national stock numbers with an acquisition value of over $600 million, required 112 tractor-trailer loads. The second workload, which included depot maintenance and materiel management of bomber aircraft and cruise missile nuclear items, began to transfer to the Oklahoma City ALC on January 1, 1999, completing the move nine months later on September 18. This was the first major materiel management workload to transfer to Tinker. One of the main challenges associated with these moves was the shipment of test equipment built with '60s technology. All of the studies conducted by directorate personnel indicated the equipment would not survive the trips; but, in partnership with Lockheed-Martin, Kelly workers figured out how to do it. The last of the various test equipment arrived at its new home on Tinker AFB in June 1999 and started working almost immediately.

Consolidation of logistical management functions associated with nuclear bombs and warheads into an Air Force Nuclear Weapons Product Support Center at Kirtland AFB occurred between June and September 2000. The final workload to transfer was that of material management for nuclear munitions handling equipment, destined for Robins

AFB. Although some shifting of workload happened in FY99 with the transfer of two authorizations on February 28 and another one on September 11, 1999, the bulk of the moves occurred later. In March 2000, the munitions handling equipment workload merged into the SA-ALC Aerospace Equipment Management Directorate's ground support equipment element and moved between January and March 2001 into Warner Robins' newly established Support Equipment and Vehicle PGM. The Nuclear Weapons Directorate at the San Antonio ALC officially closed on September 23, 2000.

Aerospace Equipment Management

Several materiel group managers (MGM) and product group managers resided within SA-ALC's Aerospace Equipment Management Directorate, including the power systems MGM, aerospace support accessories MGM, automatic test systems PGM, and ground support equipment PGM. Dividing this directorate's responsibilities among the remaining ALCs proved challenging because of the multitude of functions and workloads involved.

This held especially true for the power systems MGM, located within the directorate's Power Systems Program Management Division. It had responsibility for auxiliary power units, secondary power systems, engine start systems, emergency power units, and fuel/electrical system components. Operations took place in five major Kelly facilities, including four industrial process areas, 10 back shops, four gas turbine engine test cells, four jet fuel systems test cells, and three air turbine starter test cells. Its resources consisted of some 600 personnel authorizations and 15,000 personal property items. On May 21, 1998, the AFMC commander General George T. Babbitt approved the disbursal of these workloads. All fuel systems not related to the secondary power systems, engine start systems, gas turbine engines, and auxiliary power units would move to the Oklahoma City ALC as part of the PBA. The Warner Robins ALC would receive the gas and diesel engine workload as part of its Support Equipment and Vehicle PGM. The rest of the Power Systems MGM would transition to the Commodities Directorate at the Ogden ALC. The first group of Power System MGM workloads began to shift to Ogden in mid-FY99, but the bulk of the depot maintenance workload moved between May and September of 2000. To avoid the costs of moving personnel twice before the September 2000 RIF, center managers advanced the transition of the materiel management responsibilities to coincide with the shift of the depot maintenance workloads.

At left, Acting Air Force Secretary F. Whitten Peters visited Kelly AFB to see how the closure process was going.

Responsibility for Kelly's aerospace support accessories MGM located within the Commodity Program Management Division and elements of aircraft-mounted fuel accessories support performed by the Fuel Systems Management Branch moved to the Oklahoma City ALC's Commodities Directorate. Early in FY99, the San Antonio ALC proposed changing the schedule of these moves to more closely align the transfers with the reduction-in-force scheduled to occur at the end of FY00. The Oklahoma City ALC, preoccupied with finalizing the propulsion business area moves during this same timeframe, wanted to keep the aerospace support accessories transition at an early April through June period. The compromise reached between the two ALCs expanded the transition so it would start in April but not end until September 2000, and this worked well for all concerned.

Several of the Aerospace Equipment Management Directorate's workloads transitioned into the Robins' Support Equipment and Vehicle Management Directorate, which Warner Robins ALC established on October 1, 1997. These included the gas and diesel engine materiel management workload and

The Directorate of Aerospace Fuels was responsible for aircraft, missile, and ground fuels used by the USAF and NASA, including propellants and special chemicals like fluorine.

automatic test systems and ground support equipment PGMs. They would be joined by the Nuclear Weapons Directorate's munitions handling equipment workload. Personnel began moving to the Warner Robins OL at Kelly in February 1999. The source of supply transferred from Kelly to Robins on September 1, 2000, followed by the designated acquisition authority a month later. Although some early movement of the automatic test systems PGM occurred in November and December 2000, most of the transfers took place in the January-March 2001 timeframe. With all of its functions relocated to the last three ALCs, the directorate closed on April 1, 2001.

Aerospace Fuels

After much discussion and debate, on October 1, 1999, the Air Force decided to transfer the aerospace fuels MGM functions, located within the Aerospace Fuels Management Directorate, to two organizations: the Defense Logistics Agency's Defense Energy Support Center (DESC) and a newly created Air Force Petroleum Office (AFPET). A DESC business unit remained at Kelly to handle retail fuel transactions and other selected missions. Since AFPET's headquarters would be collocated with DESC at Fort Belvoir, Virginia, the directorate established an OL there with three military positions on October 3, 1998. That completed the first phase of the transition plan. The second phase involved the finalization of personnel requirements and moves, approval of organizational structure, and implementation of the workload moves. Standup of AFPET, movement of the aerospace fuels MGM position to Virginia, and transfer of all remaining functions to DESC concluded the third and final phase. Unfortunately, the time table for the plan fell apart due to a delay in fielding DLA's new Fuels Accounting System, which caused the Air Force to cancel the scheduled October 1, 1999, transfer of the MGM function from the San Antonio ALC. This proved to be a real show stopper for without it, there was no mechanism to transfer the Air Force Fuels Working Capital Fund to the Defense Logistics Agency's Fuels Working Capital Fund.

The new implementation date of the Fuels Accounting System wasn't scheduled until after the San Antonio ALC closed in July 2001, which meant the Aerospace Fuels Management Directorate had to continue operations at Kelly well beyond July 13. As a result, a plan to realign the directorate as a detachment of Warner Robins ALC began to emerge. The potential loss of experience within the fuels workforce, which stood to be exposed to future BRAC-driven RIFs, was an unlooked for consequence of this organizational delay. As a result, Kelly's civilian personnel officer sought an exception to policy that would allow the Warner Robin's civilian personnel flight to service the directorate's workforce once it became a detachment of that ALC. The Air Staff approved Kelly's request on August 13, 1999, and the Aerospace Fuels Management Directorate realigned under Warner Robins ALC on October 1, 2000, as Detachment 3 of the Air Force Petroleum Office. Some 92 aerospace fuels personnel realigned under Warner Robins, but stayed at Kelly in building 1621. Headquarters AFMC estimated that the DESC

The Aerospace Fuels Management Directorate was realigned under the Warner Robins ALC as Detachment 3, Air Force Petroleum Office.

and materiel management transfers would occur no earlier than October 1, 2001.

Technology and Industrial Support

Many of the center's workloads relied on back shop support provided by the Directorate of Technology and Industrial Support. This linked the fate of most of the directorate's resources to the transition of the depot maintenance workloads discussed previously. Responsibility for Kelly's Science and Engineering Laboratory reverted to GKDC, which commercialized it on December 1, 1998. The Technology and Industrial Support Directorate also turned over its foundry, a part of Kelly operations since 1917, to the GKDC on August 4, 1999, for future commercialization. Part of the directorate's Textile Lab transferred to the 311th Human Systems Wing's Human Systems Program Office at Brooks AFB in the latter part of 2000. The Brooks office also assumed responsibility for the Continuous Acquisition and Life-Cycle Support Branch as well as portions of the Engineering and Technical Data Management Branch around the same time. Its Mission Critical Computer Resources Software Division completed the transfer of engineering data to gaining ALCs in February 2001. On March 30, 2001, the ALC closed the Technology and Industrial Support Directorate as the final remnants of its mission transferred to other AFMC organizations.

Not everything was about base closure. In September 1999, the San Antonio ALC held a POW/MIA remembrance. Senior Airman Noel Freeman played taps in front of the headquarters.

Thousands of pounds of equipment were shipped out of Kelly destined for the remaining three ALCs.

Functional Organizations

The ALC's functional organizations experienced a similar drawdown and splintering of their missions as the date of the final reduction-in-force, scheduled for April 2001, approached. As a support organization, personnel elements within the Financial Management Directorate realigned to gaining centers with their associated maintenance and management workloads. Additionally, some elements of the Financial Services Office were reassigned to the 37th Training Wing as part of the transfer of base operating support under the realignment of work from Kelly to Lackland AFB. The Financial Management Directorate ended operations on July 1, 2001. Likewise, the fate of various elements

Boxes lined the hallways of building 171 before shipment.

of the Contracting Directorate, which had been matrixed to the product directorates since their establishment in October 1990, was tied directly to the realignment of their respective item managers. The workload from the directorate's Operational Contracting Division shifted to the 37th Training Wing's contracting squadron. The Contracting Directorate at the San Antonio ALC closed on June 30, 2001.

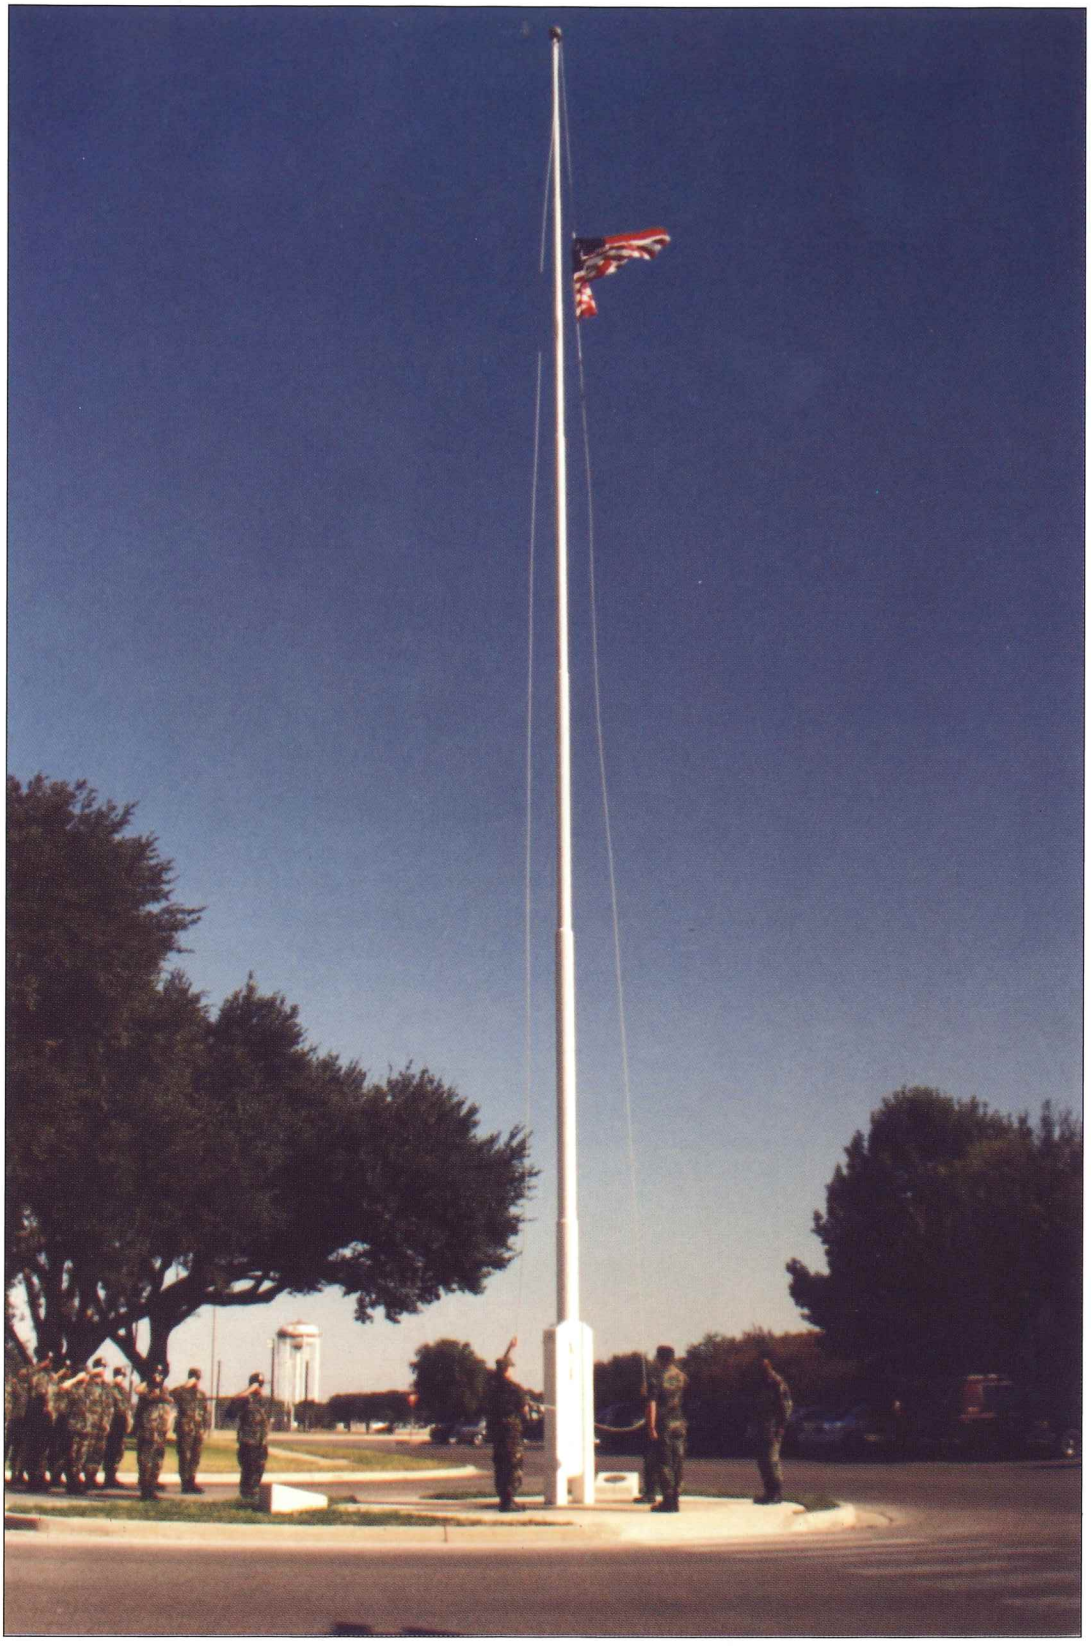

The fate of Kelly's Environmental Management Directorate was closely linked with all the actions the center had been involved with in its closure and realignment operations. It closed on April 1, 2001; and its work and mission were assumed by the Air Force Base Conversion Agency office at Kelly. Necessarily, the BRAC Implementation Directorate, which had orchestrated all of the closure and realignment actions since its inception in August 1995, was one of the last organizations the center closed. With its work all but done, the San Antonio Air Logistics Center disestablished the BRAC Implementation Directorate on July 1, 2001, less than two weeks away from its own inactivation.

651st Combat Logistics Support Squadron

The drawdown of the personnel assigned to the 651st Combat Logistics Support Squadron (CLSS) depended on mobility commitments. At the end of fiscal year 1999, the plan was to align the squadron's taskings piece-by-piece between the second quarter of fiscal year 2000 and the third quarter of fiscal year 2001. The first part of the squadron to move was the C-17 Aircraft Battle Damage Repair teams, which reported to the 653d Combat Logistics Support Squadron at Robins AFB in Georgia on October 1, 2000. The propulsion teams transferred to the 654th Combat Logistics Support Squadron at Tinker AFB, Oklahoma, in April 2001, while the transportation and supply elements, commonly known as Rapid Area Distribution Support, were divided between two of the remaining ALCs. With the expertise these team members had in packing, crating, transporting, and tracking assets, they—along with the CLSS command section—were the last of the 651st personnel to leave Kelly AFB. They departed on April 30, 2001, the same day AFMC inactivated the 651st Combat Logistics Support Squadron.

Some personnel within the Financial Management Directorate moved across the runway to Lackland AFB.

The 651st Combat Logistics Support Squadron held a final retreat ceremony on April 2, 2001. Twenty-eight days later AFMC inactivated the unit.

The Mechanics of Redevelopment

With previous rounds of base closure "under its belt," the Defense Department had a wide variety of resources available to help communities redevelop their bases. John "Mac" McCarthy, the DOD Base Transition Officer, started work in July 1995 to help guide the city and the base through the entire process. In December, the Air Force established the Kelly office of the Air Force Base Conversion Agency (AFBCA), created by the Secretary of the Air Force to manage the conversion of property at BRAC bases to benefit the associated communities. Led by Pat McCullough, its responsibilities also included environmental cleanup and property transfer. These two teams would guide the local redevelopment agency, first Greater Kelly Development Corporation and after November 1999 the Greater Kelly Development Authority, and San Antonio ALC's Privatization and Realignment Directorate, renamed the BRAC Implementation Directorate, through the complicated process necessary to turn an 80-plus year old air force base into a modern industrial and distribution park.

On July 20, 1995, the San Antonio City Council approved establishment of the Initial Base Adjustment Strategy Committee (IBASC) to begin developing strategies and plans to redevelop Kelly. A true "citizens committee," the IBASC ultimately had over 160 members from all aspects of the San Antonio community united behind one, overarching goal: the creation of comparable paying jobs to provide a basis for ongoing economic development. Several Kelly employees (Frances Alvarado-Garza, Rose Moran, and Linda Morrow), AFGE Local 1617 President Jesse Salcedo, and former SA-ALC Commander Major General (Retired) Richard D. Smith joined other civic leaders on the executive committee.

On November 21, 1995, coinciding with Kelly AFB's 79th anniversary, the IBASC presented a draft of its strategic plan to the city council. It envisioned the creation of an "industrial mega-center" with plans for an aerospace industrial complex, a warehouse and distribution complex, a build-to-suit industrial park, and areas for administrative support. City council members approved the final version entitled "Strategic Plan for the Redevelopment of Kelly Air Force Base" on December 7. Once the city council approved the report, the IBASC's function was finished. Next on the schedule was creation of a local redevelopment authority to turn the vision into reality.

Major General James S. Childress assumed command of the San Antonio Air Logistics Center in December 1995.

On January 18, 1996, the City Council appointed four business leaders, two lawyers, and a labor official to the Kelly AFB reuse board to direct the nonprofit Greater Kelly Development Corporation to implement the redevelopment plan. Retired Air Force General H. T. Johnson was named Chairman of the Board, and retired Air Force Brigadier General Paul Roberson became Executive Director. Five of the seven appointees met on Kelly AFB for the first time on January 22. Also at the meeting was Major General James S. Childress, Commander of the San Antonio Air Logistics Center. He told the group that he would cooperate closely with the city and the GKDC. He also agreed to find a location on

Kelly for the GKDC so the board's staff could be near base officials for consultation and planning.

On July 23, 1996, the Greater Kelly Development Corporation signed its first lease with the Air Force and moved into building 43, conveniently sharing the facility with the Privatization and Realignment Directorate, the DOD Base Transition Coordinator, and the AFBCA senior representative. One of the first things GKDC had to do was hire a master planner. On August 9, 1996, the GKDC board of directors chose EG&G Incorporated as the prime integrating contractor for the redevelopment of Kelly AFB. The management team to oversee Kelly's transition was in placed.

The Defense Megacenter San Antonio was one of the DOD organizations that remained on Kelly after the closure of the San Antonio Air Logistics Center.

The overarching goal of the GKDC was to have the logistics center and tenant organizations vacate Kelly east of the runway as quickly as possible so that it could begin leasing land and facilities to interested companies. However, President Clinton had directed the Air Force to use the full six years to phase out depot work at Kelly. Time-phased reductions, Clinton hoped, would ease the impact on the local community. In the early stages, it was unclear what land and facilities would become available. As privatization in place yielded to commercialization, the picture began to clear.

GKDC's vision for post-2001 Kelly involved five different elements: an intermodal logistics distribution center located in the warehouse district in north Kelly; an area for administration and services in "downtown" Kelly; a light, build-to-suit industrial

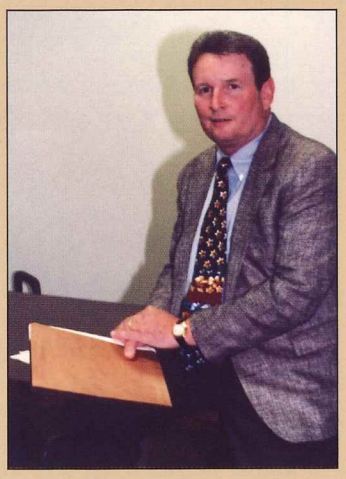

EG&G assumed Kelly's distribution workload from the Defense Logistics Agency on March 13, 1998.

KEY PLAYERS

The principal architects of Kelly's highly successful land and infrastructure transformation were Tommy Jordan, Director of SA-ALC's BRAC Implementation Directorate (originally the Privatization and Realignment Directorate); Patrick McCullough, Senior Representative of the Air Force Base Conversion Agency; John "Mac" McCarthy, DOD Base Transition Coordinator; and Paul Roberson, Executive Director of the Greater Kelly Development Authority. Since 1995 this group had led the effort to ensure that both the Air Force and the San Antonio community met their goal in the redevelopment of Kelly AFB.

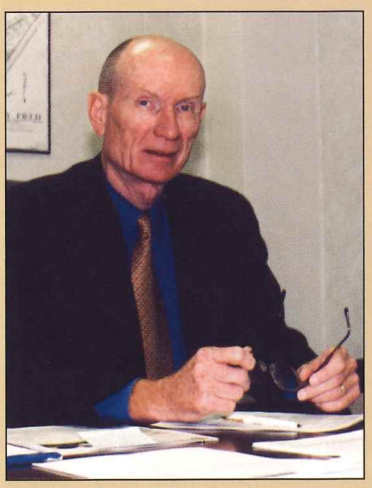

Tommy Jordan

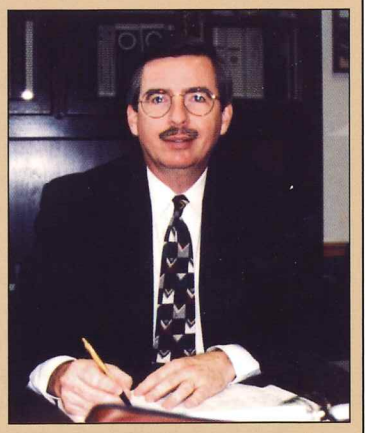

Pat McCullough

The job of closing the ALC, realigning Kelly AFB to adjoining Lackland AFB, and redeveloping a military industrial center into a going civilian concern was the most challenging and complex in the history of base closure. These four men led the process of economic redevelopment years before closure. Because of the nature of Kelly's mission, not everything could be moved at the same time; and because of the political interest in the process, the full six years allowable by law had to be taken.

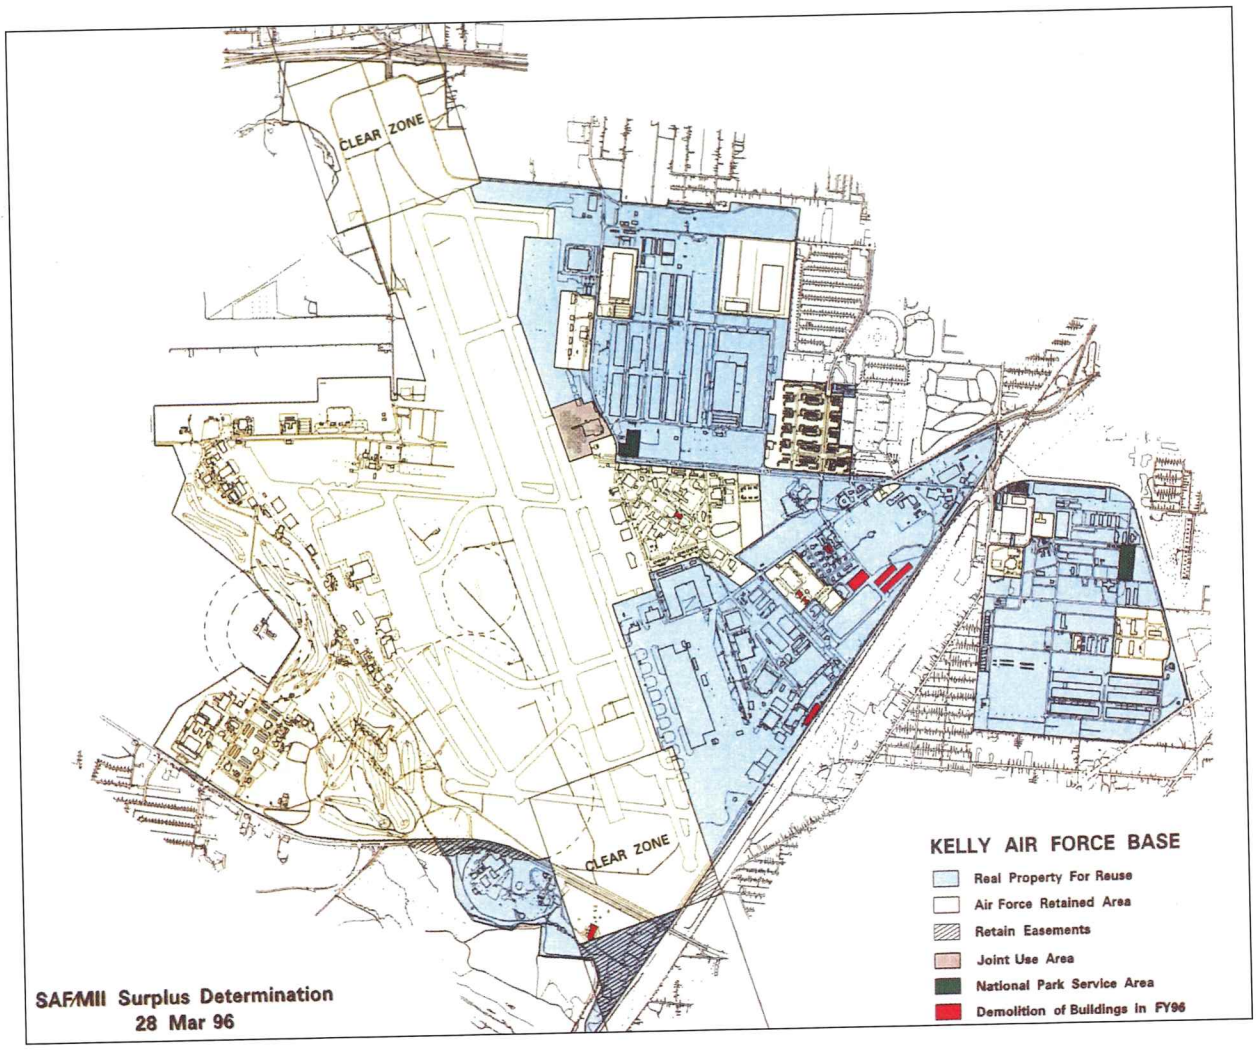

Paul Roberson

Several things helped Kelly achieve success. First was the creation of the Initial Base Adjustment Strategy Committee by the City of San Antonio. The 168-person committee spent a lot of time and energy creating a redevelopment vision for the base. Then SA-ALC set goals for the process and stuck with it during the six-year journey to closure. Those priorities included continuing support to the Air Force mission: taking care of Kelly people by offering them as many choices as possible; working with the City of San Antonio to minimize the impact of losing its largest employer; and finally, turning a going concern, not just empty facilities, over to the GKDA in 2001.

Mac McCarthy

The goals remained unaltered, and the air logistics center developed an extraordinary relationship with the GKDA. Early on, Tommy Jordan, Pat McCullough, Mac McCarthy, and Paul Roberson formed a working partnership to make the transition succeed, and it worked. Kelly was the most successful transition in BRAC history. But the real heroes in the Kelly BRAC success story were the workers themselves. Said Tommy Jordan, "They were professionals who had a job to do, and they continued to do it with pride, dignity, and professionalism."

park on East Kelly; the industrial area; and a build-to-suit section on city-owned land west of the runway. To bring this vision to reality, GKDC wanted to gain ownership of all property east of the runway, including the appropriate personal property (equipment), and acquire this property at the least possible cost with the fewest strings attached to its future use.

On October 31, 1996, Air Force Secretary Sheila Widnall, San Antonio Mayor Bill Thornton, and GKDC Chairman H. T. Johnson signed the Memorandum of Agreement for the Conversion of Kelly AFB from Military Use to Civilian Reuse. As a broad statement of principles, the document was a starting point for resolving any differences that might arise between the city and the Air Force as the complex reuse plan unfolded.

One of the first orders of business was to begin work on the method of transferring the Kelly property to GKDC. In December 1996, representatives from the Air Force Base Closure Agency and GKDC met to discuss the overall strategy to consider value and price issues for the land and personal property, financial terms, and the properties considered for transfer. They decided to use an Economic Development Conveyance (EDC) to convey the property to the city. Everyone had a tight time line to follow to get everything signed in time for the Air Force to award the C-5 maintenance contract in the summer of 1997.

As the summer deadlines neared, GKDC, AFBCA, EG&G, and the consultants KPMG Peat Marwick began holding regular discussion on the technical aspects of the EDC application. By the end of May, formal negotiations occurred between AFBCA and GKDC to hammer out the final provisions of the conveyance. How much were Kelly land, facilities, and equipment worth? Early in June 1997,

the Air Force hired the accounting firm of Arthur Anderson to find out, and on June 18, 1997, the Air Force and GKDC negotiators reached final agreement to the terms for the EDC. GKDC and the City of San Antonio agreed to pay the Air Force $108 million over 40 years for Kelly real and personal property, the largest and longest of the 19 EDCs the Pentagon had done nationwide through March 1997. The deals at Kelly and McClellan were new because they potentially would be the first to have privatized work done along side new commercial business.

On July 24, 1997, in a 20-minute ceremony at the Spanish Governor's Palace, San Antonio officially took over Kelly AFB east of the runway. Assistant Secretary of the Air Force Rodney Coleman earlier had signed the Disposal Record of Decision, the EDC, and the lease in furtherance of conveyance in Washington, D.C. The six major documents and supporting agreements signed by Navarra Williams, acting chairman of San Antonio's redevelopment authority, committed GKDC to pay the Air Force $108 million beginning in 2003. The Air Force and GKDC signed a 50-year lease in furtherance of conveyance, which would be converted to deeds as the Air Force completed environmental cleanup of each parcel of land. Under the lease, the GKDC would take control of the property in phases as the Air Force moved out and sublease the buildings to private contractors or commercial tenants.

In 1997 the federal government transferred jurisdiction of East and Main Kelly to the State of Texas. Security forces on base now called city police when the offense involved a state law.

While $108 million for all of the personal property and land east of Kelly's runway was reasonable, it was still a daunting price for the GKDC to pay while it was trying to redevelop the base into a business park. However, the Defense Authorization Act for fiscal year 2000 changed the law requiring the local redevelopment authorities to pay fair market value for the federal property. Now the Defense Department could transfer surplus property at no cost if it were used to generate jobs.

On March 2, 2000, Defense Secretary William Cohen spoke at a luncheon sponsored by the Greater San Antonio Chamber of Commerce, announcing that the "price" for Kelly had dropped from $108 million to $5.2 million, which covered those Kelly facilities that had been paid for by user fees—the Galaxy Club, the Auto Skills Center, and East Kelly's FamCamp. Secretary Cohen said, "I think San Antonio is a shining example that there is, in fact, life after BRAC."

Air Force and GKDC officials also looked at how and when GKDC would assume responsibility for operating the base. Previous experience showed that a cooperative agreement provided an excellent mechanism for the Air Force to fund the local redevelopment authority, in Kelly's case the GKDC, through a grant to perform base operating support (BOS). With an early turn over of responsibility, the Air Force could get out of the BOS business before closure and realignment while giving the GKDC an opportunity to learn how Kelly AFB worked one part at a time. What made the use of a cooperative agreement at Kelly so significant was the fact that the Air Force was transitioning BOS responsibility to the redevelopment authority so early in the process.

On April 30, 1997, officials from the Air Force Base Closure Agency and the Greater Kelly Development Corporation signed the basic cooperative agreement for East Kelly, which included only initial operations. By September, GKDC's contractor, EG&G, had hired about 14 former Kelly employees to supplement its contracted work force on East Kelly. On October 1, 1997, GKDC assumed the remaining BOS responsibilities, including resource and fire

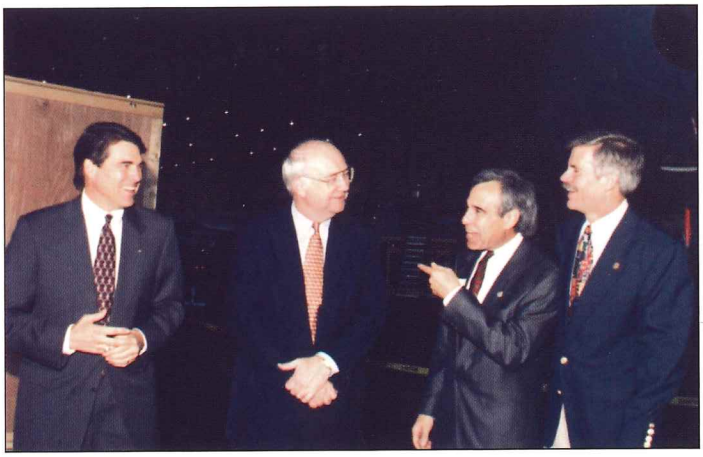

Staff Sergeant Francisco Parade, a bioengineer craftsman, calibrates an air sampling pump.

protection and emergency medical response. The transfer of the first part of Kelly was complete.

For the GKDC to assume these responsibilities, legislative jurisdiction over Kelly had to be returned to the State of Texas. On January 16, 1997, Jimmy Dishner, Deputy Secretary of the Air Force for Installations signed the East Kelly retrocession package and sent it to Texas Governor George W. Bush for signature. Governor Bush accepted the retrocession package on March 25 and forwarded it to the Bexar County Clerk to be recorded. On July 1 Mr. Dishner signed the retrocession of exclusive federal jurisdiction over main Kelly and forwarded it to Governor Bush, who signed it on July 18. The Bexar County Clerk recorded it in the county real property records on July 23. At that time, legislative jurisdiction of the base east of the runway returned to the State of Texas. This action, along with the annexation of Kelly by the City of San Antonio on December 31, 1996, meant that the San Antonio Police Department would respond to calls from the 76th Security Forces Squadron when it was a matter of enforcing state law on base. On October 1, 1997, contracted security guards from Sterling Smith Security replaced Air Force security forces who had been guarding the East Kelly gate.

Meanwhile, other workloads came under the auspices of the cooperative agreement. Amendments to the basic agreement through August 1999 vastly extended GKDC's custodial responsibilities on Kelly. On August 29, 1997, GKDC and AFBCA signed the amendment putting the Environmental Process Control Facility, Kelly's industrial waste water treatment plant, under the cooperative agreement. On September 1, OPTECH, the company hired by GKDC, took over full operation of the facility.

GKDC officials began looking for a contractor to run Kelly's Precision Measurement Electronics Laboratory after signing an amendment to add this facility to the cooperative agreement on September 26. General Electric Industrial Control Systems, the contractor hired by GKDC, took over the calibration and repair workload on March 30, 1998. The Air Force and GKDC signed another amendment, which went into effect on March 31, 1998, and full base operating support for the industrial area fell under the auspices of the local redevelopment authority. The Greater Kelly Development Corporation also picked up responsibility for all facility and ground maintenance for the remainder of the base east of the runway on August 6, 1999. In addition, this cooperative agreement also transferred Kelly's foundry to the GKDC for commercialization.

In August 1999 Congressman Charlie Gonzalez talked with Texas Lieutenant Governor Rick Perry (left), Senator Phil Gramm, and San Antonio Mayor Howard Peak after a ceremony in building 375.

Airfield Joint Use Agreement

Congressman Henry B. Gonzalez talked with reporters during a visit to Kelly AFB in mid-1999.

While the BRAC Commission directed that Kelly's two-mile long runway be realigned to Lackland AFB, joint use of this asset was, according to Paul Roberson, "the cornerstone of GKDC's ability to foster civil aviation related reuse activities." Secretary of the Air Force Sheila Widnall approved joint use of the runway in principle in November 1995, but much work was required to make this happen. Under the agreement, the Air Force would continue to own and control the runway, taxiways, tower, navigational aides and other portions of the airfield, but a large amount of ramp accessible property on the east side would be available for commercial use. Two operational flying units, the Air Force Reserve Command's 433d Airlift Wing and the Texas Air National Guard's 149th Fighter Wing, would remain on Kelly. The joint use agreement could not be finalized until completion of an environmental study addressed the existing and projected increases in flying at the airfield, but Air Force planners wanted to hold concurrent negotiations with GKDC to expedite the time-consuming process as much as possible. On April 6, 1998, General Childress forwarded a proposed airfield joint use agreement, which had been developed in conjunction with the GKDC, Headquarters AETC, and Air Staff planners, to Headquarters AFMC, which in turn, forwarded the agreement to the Air Staff and the Office of the Secretary of the Air Force.

During a visit in May 1999, Air Force Deputy Assistant Secretary Jimmy Dishner, notified GKDC that the Air Force had decided the joint use agreement required completion of a more comprehensive environmental impact statement rather than a less involved environmental assessment. In early September 1999, the Air Force Center for Environmental Excellence at Brooks AFB awarded the contract to perform the study within the next 12 months. Completion of a supplement to Kelly's

Airmen from the 149th Fighter Wing at Kelly prepare an F-16 for flight.

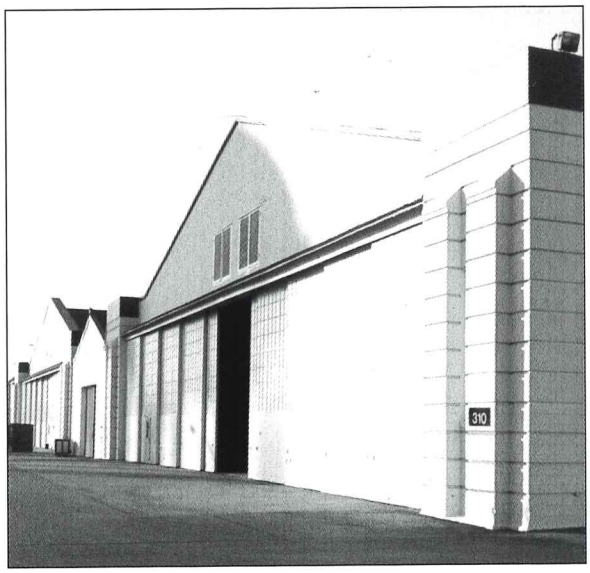

The new GKDA headquarters building was completed in early 2001.

existing programmatic environmental impact statement for joint use and other changes in airfield operations would enable Kelly to formalize, sign, and implement the joint use agreement. GKDC officials believed that if the contractor completed the study by September 2000, the joint use agreement would be implemented by July 2001 or earlier. Until then, commercial aircraft could still land at Kelly by obtaining a landing permit from the Air Force.

The contractor completed the draft environmental impact statement in June 2000. After wending its way through various stages and public comment periods, the Air Force released the final statement; and on December 14, 2000, the Secretary of the Air Force signed the Record of Decision, authorizing concurrent civilian and military flying operations at Kelly. The Greater Kelly Development Authority and the Air Force signed the airfield joint use agreement shortly after the SA-ALC flag came down the final time on July 13, 2001.

Commercialization of Kelly

One of the short-term goals espoused by the GKDC in March 1996 was having at least one commercial tenant on Kelly by the following November. Center officials dovetailed their objectives to this; their objective was to provide an environment attractive to quality contractors who would use the Kelly industrial capability and work force on a long-term basis to protect Air Force readiness and expand the business base.

Pratt & Whitney set up its Kelly operation in building 310.

Pratt & Whitney

The plan proved doable. After much discussion, Pratt & Whitney San Antonio found a good match between its requirements and excess Kelly facilities. On June 5, 1996, the company submitted an interim lease application for building 310, which became available in September when the F100-220 two level maintenance work previously being performed there ended. On October 2, 1996, GKDC and Pratt & Whitney announced plans to open a jet engine overhaul and repair facility in building 310, signing the lease on October 21. The operation was up and running fairly quickly. On November 25, 1996, Pratt & Whitney employees began work on the first six F100 engines. Only 10 months later, on September 4, 1997, Pratt & Whitney senior officials notified General Childress that the company would designate the site at Kelly as its center of excellence for F100 military overhaul, and all of its F100 engine work would move to Texas over the next six months. By the year 2000, Pratt & Whitney employed more than 300 workers at Kelly.

Rail Car America was the first private company to lease a part of East Kelly.

Rail Car America

On September 16, 1996, San Antonio Mayor Bill Thornton announced that Rail Car America, a company that repaired railroad rolling stock, would lease some 33 acres of land on East Kelly for a new repair center. Before beginning operations, Rail Car America would make a $1.5-$2 million investment on East Kelly to repair track and ties in the area and to add a transfer table, two buildings, a repair shop, and a storage track. The company planned to hire between 75 and 100 people to work in the new facility. Rail Car Texas (the Texas branch of the company) signed the initial lease on March 3, 1997, and the first major piece of equipment, a switch engine, arrived shortly thereafter.

On May 13, 1998, DLA awarded a one-year contract with EG&G to privatize its distribution depot at Kelly.

Defense Distribution Depot Privatization

In addition to closing the San Antonio ALC, the 1995 BRAC decision directed that the Defense Distribution Depot San Antonio be disestablished and its workload consolidated at other DOD depots or private commercial activities. One of the goals from San Antonio's initial redevelopment planning efforts was to turn Kelly's warehousing complex into a multi-modal distribution center. Toward that end, both SA-ALC and GKDC officials encouraged the Defense Logistics Agency to privatize its workload at Kelly instead of moving the thousands of items stored in warehouses and open storage areas. On January 14, 1997, DLA

officials formally announced their intention to shift the government work force at Kelly to a privately run, commercial distribution facility. As a result, nearly 600 DLA employees at Kelly became eligible to sign up for the DOD priority placement program. Ultimately 522 workers registered in PPP. And by the end of the fiscal year, 76 employees had received job offers in the local area while another 67 had offers outside the local area. On September 12, 1997, the distribution depot issued reduction-in-force notices to the remaining employees for a RIF to take place the following March.

On May 1, 1997, DLA officials issued the request for proposal for privatization of the Defense Distribution Depot San Antonio. Seven months later, on December 8, 1997, DLA awarded a one-year contract with three one-year options worth $30 million to EG&G Management Services of San Antonio, Inc., to manage the privatization of the depot. EG&E assumed responsibility for the workload during ceremonies on March 13, 1998. The privatization of the distribution and warehousing work created over 500 new commercial jobs at Kelly.

One of the tasks that had to be completed by July 2001 was emptying the Kelly warehouses. Inventory draw down efforts began in October 1996 and proceeded rapidly. In November 1996, DLA designated Kelly as an attrition site and stopped accepting receipts (except those for depot maintenance or local use) in May 1997. By the end of May, over 11 million assets had gone out of Kelly warehouses. The amount of storage space this inventory occupied totaled almost 20 million cubic feet. By the end of FY99, center personnel had reduced this to approximately 6 million cubic feet, well on their way to the goal of zero inventory by December 2000.

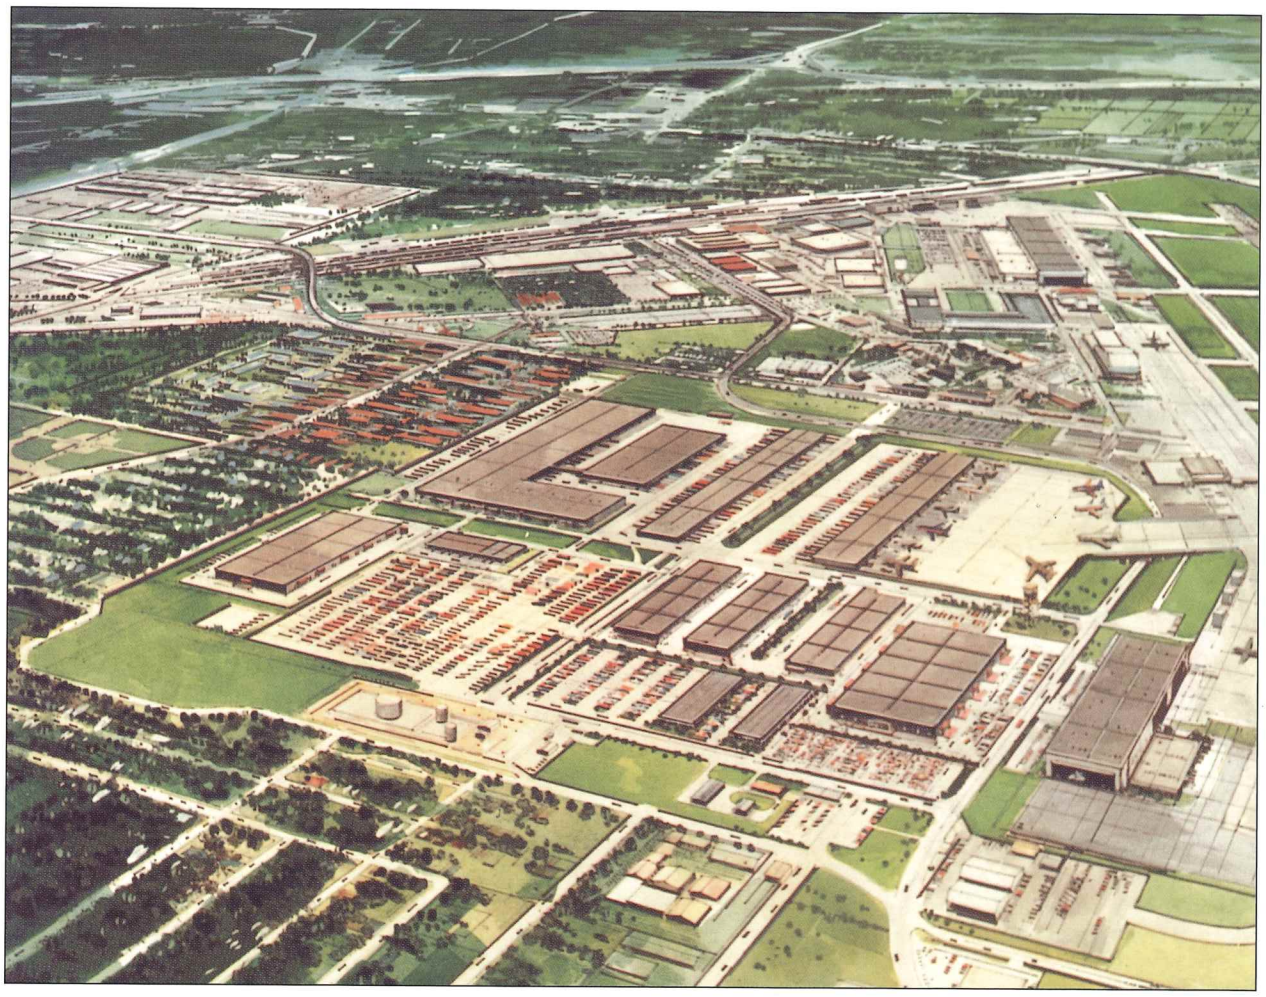

Ryder Integrated Logistics Terminal

Working with the San Antonio Free Trade Alliance, GKDC offered Kelly as one of the sites for the North American Transportation Automation Prototype (NATAP). Sponsored by the U.S. Treasury Department, NATAP and Ryder Integrated Logistics hoped to demonstrate the viability of electronically pre-clearing southbound trucks into Mexico, aiming to make the customs process paperless. Following the lead of its two largest customers, General Electric and Xerox, Ryder opted to participate in the test and designated San Antonio as its dispatch point to and from Mexico. GKDC offered Ryder space in building 1536, and the trucking company moved into the facility in July 1997. On September 29, 1997, Ryder Integrated Logistics and GKDC signed a one-year lease with a five-year extension option for 13,000 square feet in building 1536. The first Ryder truck left the base with a load of Xerox copiers destined for Mexico on November 5, 1997. This was lauded as "the first small step toward San Antonio's vision of a Multi-Modal Distribution Center that takes advantage of the North American Free Trade Alliance to make San Antonio a logistical hub for truck, air, and rail service."

On June 14, 2000, the redevelopment of Kelly AFB took another step forward with the inauguration

Ryder Integrated Logistics leased warehouse space in building 1536 to use as its dispatch point for trade to and from Mexico.

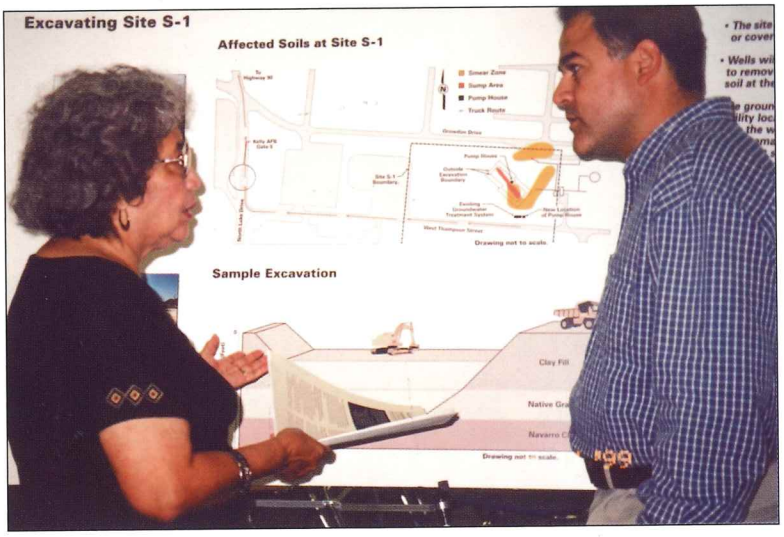

Turning Kelly AFB into an international transportation hub, as well as preserving the industrial complex as a major aviation maintenance overhaul facility was the vision planners had for "KellyUSA".

of KellyUSA's General Purpose Foreign Trade Zone at the Ryder Integrated Logistics Center located at Kelly. GKDC officials started work on the foreign trade zone in 1996, receiving the designation in September 1997. However, no activity could take place until the U.S. Customs Service granted activation status. It was Ryder's business negotiations with H&M Company, Inc., that initiated the activation of the Foreign Trade Zone on Kelly. The H&M Company imported harness tape and metallic static bags from China into Kelly and then exported these items into Mexico. Ryder's group logistics manager at Kelly expected the Trade Processing Center and cross border business to continue to grow with the Foreign Trade Zone activity. Once the Air Force and the Greater Kelly Development Authority signed the Airfield Joint Use Agreement, everyone hoped the international trade operations at Kelly would take off and reach their full potential.

Environmental Management

Kelly's 80-plus years of flying and depot maintenance operations had taken a toll on its environment. The damage was the result of industrial work performed at Kelly for decades before today's scientific knowledge and environmental laws existed. Kelly workers had always employed practices common throughout the country for the treatment and disposal of what now is known as hazardous material. The base's cleanup program was the response to that legacy; and the Air Force was committed to the environmental cleanup of Kelly. As of the year 2001, the Air Force had spent almost $250 million to find, measure, and cleanup past contamination. Another $320 million was earmarked for further cleanup efforts. The Air Force's goal was to have all remediation systems in place by 2004 to clean up the contamination. Even though the air

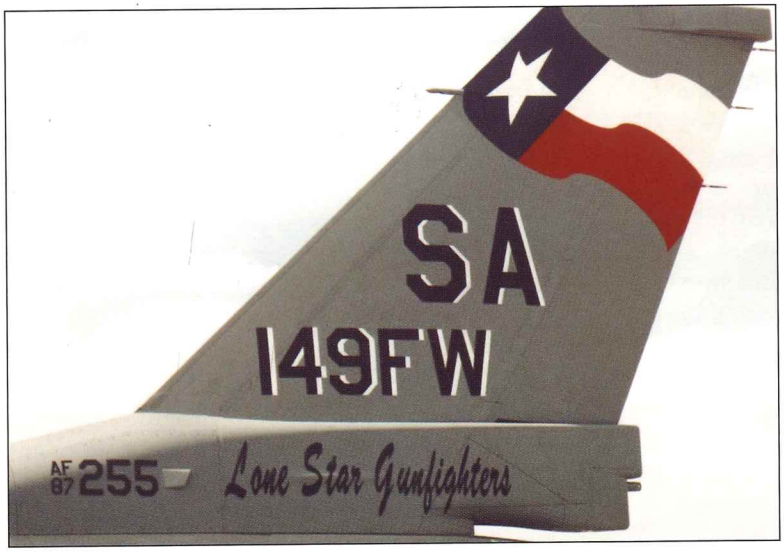

The Air Force was committed to cleaning up all contamination its operations caused at Kelly.

logistics center closed in July 2001, the Air Force Base Conversion Agency, which would remain on Kelly for years to come, would continue meeting the Air Force's responsibilities to clean up the pollution it caused.

Kelly's Realignment

The BRAC decision directed Kelly's runway and the land west of the runway to realign to Lackland AFB, which would make that installation one of the largest Air Force bases in the world. It also directed those organizations west of the runway to become tenants of Lackland, including the Air Intelligence Agency, the 433d Airlift Wing (Air Force Reserve Command), and the 149th Fighter Wing (Texas Air National Guard).

One of Kelly's tenants, the 838th Engineering Installation Squadron (EIS), that the BRAC commission told to move from East Kelly to Lackland did not move. But unlike the Air Force News Agency and the Midwest Region Headquarters of the Defense Commissary Agency which choose to remain in their buildings on East Kelly and become tenants of the GKDC, the 838th was inactivated. The cost to build the squadron new facilities grew prohibitive so, as part of the streamlining of force structure resulting from the 1997 Quadrennial Defense Review, the Air Force announced on February 10, 1998, that the 838th would inactivate. On June 30, 2000, the squadron completed the last of its projects. Over the past year, two teams from the 838th EIS worked to complete critical cable projects supporting Kelly's realignment. Also on June 30, the squadron brought home its last deployed members who had worked at Minot AFB and Grand Forks AFB, both in North Dakota, as quality assurance evaluators for telecommunication installation contracts. In addition, the last 838th EIS electronics project was completed on June 21 at Holloman AFB, New Mexico. Squadron members were now fully focused on the mission of closing the unit. On December 15, 2000, AFMC inactivated the 838th EIS, ending its 42 years of service to the United States.

One of the F-16 assigned to the 149th Fighter Wing at Kelly received new tail markings to go along with the wing's new mission--providing F-16 training to regular Air Force fighter pilots.

Almost as soon as the last BRAC commissioner voted to close the San Antonio ALC and realign the base, center officials began thinking about how to preserve the base's long heritage and keep the name Kelly alive. On May 28, 1997, the SA-ALC commander asked his counterpart at

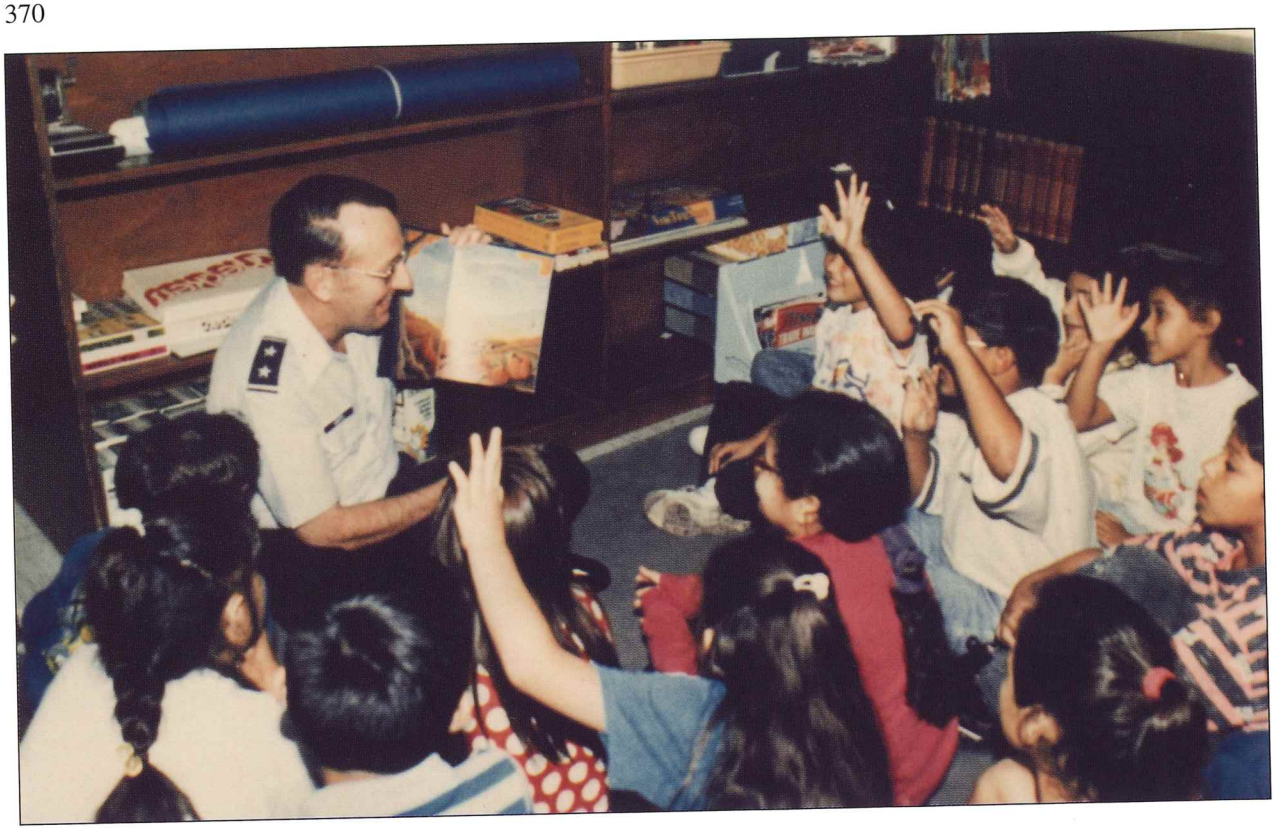

Air Intelligence Agency was one of the residents on the west side of the Kelly runway. With the closure of the San Antonio ALC, the agency became a tenant of Lackland AFB.

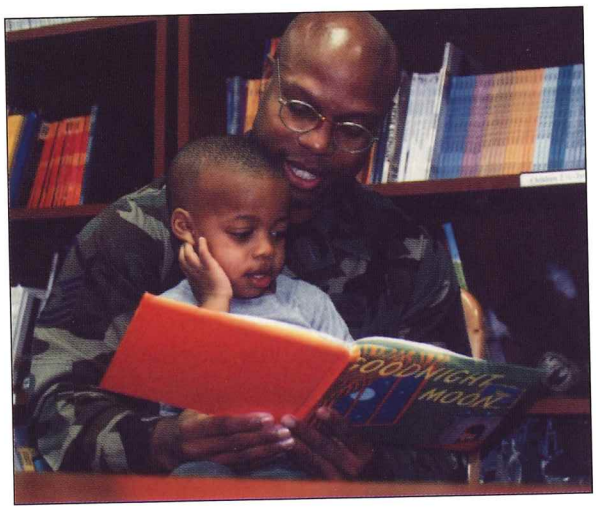

Lackland for his support in keeping the "Kelly Field" name for the portion of land that would realign under Lackland's jurisdiction. He agreed, and in August, Headquarters AETC concurred with the request to retain the name "Kelly Field Annex" on runways, ramps, and taxiways after they realigned to Lackland. With this action, the heritage of Kelly Field, as the oldest, continuously active military airfield in the United States Air Force, would be preserved.

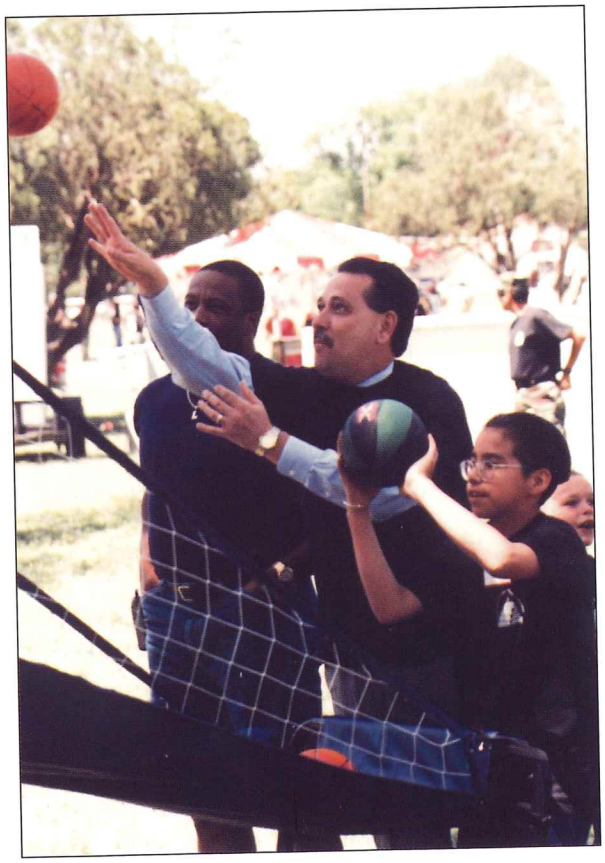

But the renaming of Kelly wasn't finished. On January 26, 2000, the Greater Kelly Development Authority (GKDA), formerly the Greater Kelly Development Corporation, unveiled a new name and logo for the area east of the runway. On July 13, 2001, Kelly Air Force Base would become "KellyUSA, the Center for Global Business." This was an important step for GKDA because it was necessary to present a civilian business park image to companies not that of a military installation. Now, those trying to retool Kelly into a civilian industrial park had a common identify to do just that.

Team Kelly

Second on the list of priorities set by the senior leadership of the ALC in the summer of 1995 was taking care of Kelly's people. And to do that,

People at the San Antonio ALC were deeply committed to their mentoring program, which paired employees one-on-one with at risk students. When the ALC closed the Air Intelligence Agency took over the mentoring program.

The FOCUS centers offered a full range of transition assistance for Kelly's workers.

General Curtis wanted them to have as many alternatives to choose from as possible, whether that choice involved moving to another government job, going to school, working for private industry, or retiring. To help with this, Kelly's Civilian Personnel Transition Team moved quickly to secure a $14 million Department of Labor Job Training Partnership Act grant for employees to begin no-cost training for other professions. The San Antonio ALC also opened a network of transition assistance centers, known as FOCUS centers, that offered a full range of outplacement assistance, stress and change management courses, skills upgrade, computer-based job search, and resume development tools. Kelly's personnelists obtained approval to implement an array of special employee entitlement and assistance programs, including Voluntary Separation Incentives, Voluntary Early Retirement Authority, unlimited annual leave accumulation, and voluntary early Priority Placement Program registration. While center managers began planning to move missions and employees in incremental stages in the 1996-1997 time frame, many employees began leaving voluntarily, and the normal turnover rate for the San Antonio ALC doubled. These losses required significant temporary hiring in those skills needed to perform the continuing mission.

On March 31, 1998, the long anticipated first reduction-in-force went into effect. Over 1,400 authorizations tied to the C-5 depot maintenance and the DLA workloads, as well as the associated support, were abolished. Of that number, 559 Kelly workers were reassigned to other positions at the base at their same salary; 322 were "downgraded" or had to take a lower paying job to remain at Kelly; and 419 took cash incentives and left the center. Only three permanent employees lost their jobs as a result of the reduction-in-force.

In April 1998, an operating location and volunteer process began for the C-5 system program director and the electronic business area and automatic test equipment workload realignments to Warner Robins. This was followed in September by the largest and most complex volunteer program to staff operating locations for the materiel management and depot maintenance workload moves planned for later in the closure process to each of the three gaining installations—Robins, Hill, and Tinker AFBs. Employees had the opportunity to volunteer for their own workload or for another operating location that would allow them to transfer to a more preferred site. Giving qualified workers a choice of location increased the number of volunteers and enabled them to be reassigned, if necessary, to gain at least a year's experience with their new workload before transferring. The operating locations also gave the gaining bases the ability to predict more accurately workforce needs because they knew how many people were transferring with the positions.

Workloads transferred during 1999 included the remaining re-entry vehicle program to Hill, the F100 CORE and portions of F100 engine maintenance to Tinker, and the C-5 materiel management and Electronic Business Area to Robins. In total, 333 workers moved to Tinker, 173 employees relocated to Robins, and 47 people transferred to Hill.

On September 11, 1999, the largest reduction-in-force in Air Force history to date took place. It was in connection with the shutdown of the propulsion business area workload. When that went into effect, some 4,000 authorizations were abolished. Of those, 1,429 employees took cash incentives to separate from federal service. Another 791 workers transferred to different jobs on Kelly. Approximately 514 permanent employees lost their jobs in the RIF. On a somewhat happier note, however, Lockheed Martin and other private employers hired about 1,000 Kelly workers.

In December 2000, the 76th Air Base Wing received an Air Force Outstanding Unit Award.

Between October 1999 and September 2000, another 687 Kelly employees transferred to one of the other air logistics centers, following C-17 management to Robins, the remaining F100 maintenance and aircraft and fuel accessory program to Tinker, and mature aircraft and power systems programs to Hill. Approximately 400 workers moved north to Oklahoma, another 24 shifted east to Georgia, and 263 employees went west to Utah.

The third major RIF occurred on September 23, 2000. Kelly separated 64 permanent employees, but civilian personnel officials working the action said the outcome could have been much worse because 2,000 positions were canceled. About 800 workers took cash incentives to separate from federal service, and another 340 were placed in other jobs at Kelly.

This also marked the final materiel management moves, including support equipment and base operating support workload realignments to Tinker, Robins, and Lackland. Some 163 employees moved to Oklahoma, another 182 relocated to Georgia, 156 shifted to Lackland in a transfer of function, and another 92 aerospace fuels employees were realigned to Robins but remained in

On September 10, 1999, the 76th Medical Group held a formal inactivation ceremony in front of the Kelly Clinic.

CIVILIAN PERSONNEL NEWS

APRIL 2001

FAREWELL.....

In a matter of days, almost all of us at the San Antonio Air Logistics Center will move on to other pursuits. In just over three months, Kelly AFB will stand down and cease to exist. Of course the buildings, streets, parking lots, etc., remain as part of KellyUSA or Lackland AFB and the airfield will be called Kelly Field. All of these things will serve as future reminders of what we were and what we did here. What won't remain is the workforce proudly known as "Team Kelly".

Whatever your future plans hold, we want to take this opportunity to extend our best wishes, and to say "Thank You" for the dedication and professionalism you have shown throughout this challenging realignment and closure process.

The task of closing the base has been gigantic in scope (see Recap on pages 2-5). Our mission, until closing, has been to provide worldwide support to the American Warfighter. Our aircraft repair, logistics, acquisition, technological and support programs were second to none. More importantly, Kelly's people have been second to none in achieving this mission objective while coping with the trauma and tasks associated with base closure.

To your credit, this workforce has not suffered any significant job loss related casualties. There have been no suicides nor have there been increased incidents of workplace violence. Productivity has remained high and workplace vandalism or theft has been negligible.

We in the Civilian Personnel Office have had an opportunity to view the workforce from a unique vantage point. While we did not work side by side with you as coworkers, we tried to help you understand and sort through the transition alternatives that were available to you. Our primary goals, simply stated, have been to help you do your job and to help you prepare for a future beyond Kelly.

From a mission and people standpoint, this closure has been the largest and most successful in Air Force history. You can all take great pride in your role and in what we collectively accomplished. Thanks again for a job well done!

M. D. DANIEL
Civilian Personnel Officer

place at Kelly. In addition, 15 medical group employees went to Wilford Hall Medical Center, and 10 nuclear weapons people moved to Kirtland.

With these moves completed, the remaining three ALCs closed their operating locations on Kelly. Hill shut its OL on October 1, 2000; Tinker closed on March 15, 2001; and Robins finished up on March 25, 2001.

On April 1, 2001, Lackland AFB assumed base support of Kelly Field Annex and its new tenants,

On October 31, 1999, the 76th Aerospace Medicine Squadron was inactivated.

the Air Intelligence Agency, the 433d Airlift Wing, and the 149th Fighter Wing. Six days later, on April 7, 2001, Kelly's fourth and final reduction-in-force took place when 2,000 positions were abolished. A total of 487 employees took cash incentives, and less than 275 actual separations occurred. In reviewing what happened to Kelly's people since the BRAC announcement in June 1995, 30 percent of the career workforce retired or resigned with cash incentives; 20 percent relocated with workloads to other installations; 17 percent went to new jobs through the Priority Placement Program—11 percent in the local area and 6 percent outside the commuting area; and another 25 percent voluntarily left Kelly for a variety of other reasons like taking other federal employment, pursuing further education and training, or starting their own businesses. Only eight percent of the workforce were separated by RIF action, and these employees received either severance pay or discontinued service retirement benefits. By providing Kelly employees with a full range of options, the goal of taking care of the Kelly workforce was met and exceeded.

Inactivation of Kelly's Units

Kelly began losing its assigned units as the year 2001 approached. On May 29, 1998, AFMC inactivated the 313th Flight Test Squadron. Then on October 1, 1998, AFMC redesignated the 76th Munitions Squadron as the 651st Munitions Squadron and assigned it to the Ogden ALC. The munitions squadron remained on Lackland's Medina Annex and continued to receive and ship munitions from Kelly's runway.

Inactivations and reassignments continued fast and furious in 1999. On August 20, Air Force Materiel Command inactivated the 76th Civil Engineer Group and its 776th Civil Engineer Squadron. Also on that date, the 76th Civil Engineer Squadron was relieved of assignment to the group and assigned to the 76th Air Base Wing. The 76th Medical Group and two of its units, the 76th Medical Operations Squadron and the 76th Medical Support Squadron, were inactivated on September 30, 1999, although the inactivation ceremony took place on September 10 so the group's commander could attend before she moved to Tinker AFB to take command of the 72d Medical Group. Air Force Materiel Command assigned the remaining unit, the 76th Aerospace Medical Squadron, to the 76th Support Group on September 30. One day later, on October 1, 1999, Lackland's 59th Medical Wing took responsibility for medical support at Kelly; and on October 31, the 76th Aerospace Medicine Squadron also inactivated.

Inactivation of the 76th Logistics Group occurred on November 30, 2000. While the group formally

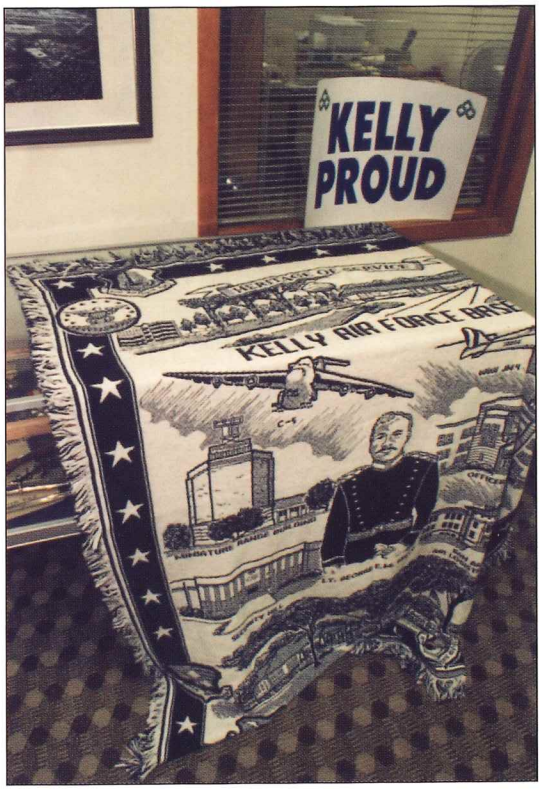

The 76th Logistics Group was responsible for shipping tons of property from the San Antonio Air Logistics Center to other bases within the command.

inactivated, its mission was far from complete. Group personnel had already packed and shipped more than 1,500 truckloads of Kelly property to other bases—more than two million items weighing more than 27 million pounds. The remaining 200 logistics workers had to transfer all remaining personal property—some 1,700 vehicles, 8,000 national stock numbers and remaining warehouses—either to the Greater Kelly Development Authority or to Lackland.

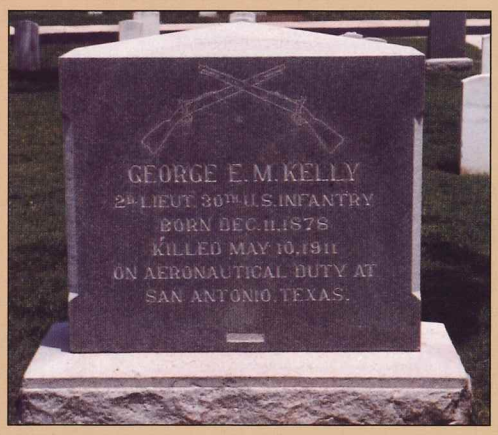

Those squadrons remaining under the 76th Air Base Wing inactivated on April 1, 2001, the date Lackland AFB assumed responsibility for the base west of the runway. These included the 76th Mission Support Squadron, the 76th Communications Squadron, the 76th Operations Support Squadron, and the 76th Civil Engineer Squadron. On April 30, 2001, the 651st Combat Logistics Support Squadron and the 76th Support Group both inactivated, leaving only the 76th Air Base Wing and the San Antonio ALC itself. While the wing held a formal inactivation ceremony on May 30, 2001, so its outgoing commander Colonel John C. Vrba could attend, it did not officially inactivate until July 13, 2001.

KELLY REMEMBERED

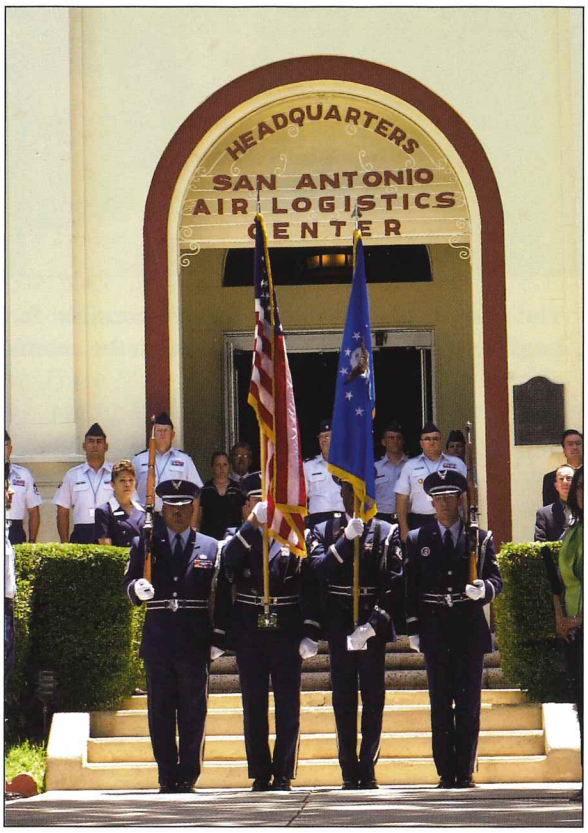

On May 10, 2001, members of Kelly AFB gathered for the last time at the San Antonio National Cemetery to honor the base's namesake, Lieutenant George E. M. Kelly. Under the shade of large oak and pecan trees and a flag flying at half-staff, about 50 people attended the ceremony, the last before the closing of the San Antonio Air Logistics Center. Kelly died 90 years earlier, on May 10, 1911, after a fatal crash on the parade ground at nearby Fort Sam Houston. He became the first military pilot to die in the crash of a military aircraft. Brigadier General Robert Murdock, SA-ALC commander, spoke at the event, saying "It's appropriate that we remember him, because he truly is what the spirit of Kelly AFB is all about. It's about sacrifice. It's about people giving 110 percent 100 percent of the time." Ed Hill, who as a child in 1918 played in the shadows of the planes taking off from the dirt runways and retired 33 years ago as a senior manager at Kelly, joined General Murdock in laying a wreath at the base of Lieutenant Kelly's gravestone.

Another Transition—Kelly Forever!

With the ceremonial inactivation of the 76th Air Base Wing completed, less than 100 people remained in about two dozen facilities throughout Kelly to finish packing the final boxes of records and personal possessions and putting the final touches on the closure ceremony and other special activities to mark the latest transition of Kelly's long history. Everything was leading up to July 13, 2001, the day the San Antonio Air Logistics Center would inactivate and Kelly Air Force would transform into "KellyUSA."

Friday, the thirteenth of July, dawned sunny and hot. By one o'clock in the afternoon, a crowd of some 2,000 people had gathered in front of the SA-ALC headquarters, building 1680, to witness the historic occasion. Former SA-ALC commanders came from all over the country: Lieutenant General (Ret) Lynwood E. Clark, General (Ret) Earl T. O'Loughlin, Major General (Ret) Waymond T. Nutt, Major General (Ret) Lewis G. Curtis, Major General (Ret) Richard D. Smith, Major General (Ret) Lewis E. Curtis III, Major General (Ret) James S.

Childress, and Major General Paul L. Bielowicz joined current SA-ALC commander Brigadier General Robert M. Murdock at the ceremony. As the crowd gathered under the 50-year-old pecan trees, they watched T-38s from Randolph AFB and F-16s and C-5s from Kelly Field Annex perform flybys. Senator Kay Bailey Hutchison, a staunch supporter from the day she took office, spoke at the ceremony, telling the crowd that "Kelly did not die. Instead, it is renewing its place in our city." Finally, the special order directing the inactivation of the San Antonio Air Logistics Center was read as General Lester L. Lyles, AFMC commander; General Murdock; and Chief Master Sergeant Schuster furled the ALC flag. After that, General Murdock presented San Antonio Mayor Ed Garza and GKDA Chairwoman Chava Gonzaba a ceremonial key to the base. In turn, GKDA raised American and "KellyUSA" flags over its new domain. Moments later a cannon fired a 21-gun salute, and the Air Force Band of the West from Lackland AFB played "America the Beautiful," as a C-5 flew over the crowd.

That evening some 2,200 former employees and friends of Kelly AFB gathered at the San Antonio Convention Center for an evening of camaraderie, reminiscences, and celebration. The ghost of Lieutenant George E. M. Kelly returned one last time to lead those in attendance on a walk down Memory Lane, highlighting the accomplishments of the last 85 years. It was a bittersweet evening, full of laughter and tears, but a most fitting capstone of more than eight decades of service.

This day marked the end of six grueling years of the largest, most complex and difficult base closure in Department of Defense history. Team Kelly should take pride in the fact that Kellyites did it with unparallelled pride, dignity, and professionalism. Kelly's people moved all of its depot level maintenance either to the private sector or to other DOD depots with relatively minor impact on its customers. Team Kelly transferred all the supply chain management for Air Force aircraft, engines, and systems to other ALCs with virtually no problems. They physically moved a quarter of a million line items of supplies in the Kelly warehouses to other DLA storage sites. The people of Kelly provided outstanding support to the war fighter during several conflicts during the closure period. Every employee at Kelly was given a multitude of choices as to what they would personally do after closure. Team Kelly worked very closely with their counterparts at the Greater Kelly Development Authority to create almost 5,000 commercial jobs at "KellyUSA." Working together,

On July 13, 2001, after years of preparation, AFMC inactivated the San Antonio Air Logistics Center. (Above) San Antonio Mayor Ed Garza addresses the crowd of about 2,000 people at the ceremony.

Team Kelly met every priority and every goal set: Kelly people continued to support the Air Force mission; they took care of their own; they minimized the impact the closure had on the city; and Team Kelly turned over a going concern to the GKDA. Kelly workers set a standard for performance under great adversity that will not be easily met. As KellyUSA gets ready for the next chapter in Kelly's history, the people of Kelly AFB can be proud of what they have accomplished and the support they have provided to their country for the past 85 years.

Kelly Forever!

THE MONUMENT

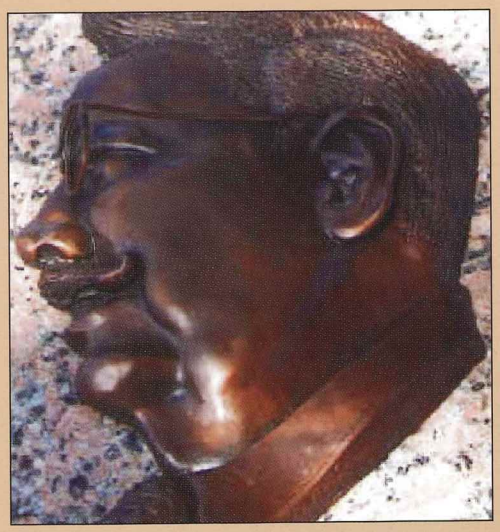

On June 20, 2001, the Kelly Field Heritage Foundation held a very special ceremony to honor two very special people. Personnel and friends of soon-to-be closed Kelly AFB came to recognize the vision and creativity of Tommy Jordan, founder of Kelly's Veterans' Monument and SA-ALC Executive Director, and Emilio Torres, a long-time Kelly employee and artist who devised the monument's unique flag design and sculpted 10 of the 12 busts that form its Ring of Honor. To mark the significant contributions these two men made to the monument, the foundation added bronze, bas-relief heads of Mr. Jordan and Mr. Torres, both created by Mr. Torres, mounted on two pink granite bases. Following the closure of the San Antonio Air Logistics Center on July 13, the Greater Kelly Development Authority would maintain the monument.

The Kelly Field Heritage Foundation honored Tommy Jordan (left column) and Emilio Torres (right) on June 20.

A LEGACY OF SERVICE—KELLY'S ENLISTED FORCE

The first group of people to be assigned at what would become Kelly AFB were the enlisted troops of the 3d Aero Squadron, sent to the new aviation post in south San Antonio in February 1917 to guard supplies and help clear and grub the land for the new airfield. Since then, Kelly's enlisted personnel have been the backbone upon which its mission was accomplished. These were the men who flocked to Kelly during World War I to learn how to maintain this new weapon, the aeroplane. They returned to Kelly in droves during World War II to learn depot level maintenance techniques from the best before deploying overseas to support flying operations in Europe, the Pacific, China, Burma, and India.

Airman First Class (A1C) Ronald Beggs, A1C Herbert Lorfing, and Airman Carlos Garcia work on an AGM-130 missile.

During World War II for the first time, there were women in uniform; they wanted to contribute to the war effort by freeing men for combat duty. In every contingency or war since then, Kelly's enlisted personnel responded as they always hadó deploying to the jungles of Southeast Asia to establish listening posts and flying signal intelligence missions, cleaning up after a tornado ripped through Kelly's warehouse area, setting up bare base shelters in Southwest Asia and repairing B-52 aircraft shot at during missions over Iraqi territory, and warning hundreds of men and women of an imminent terrorist attack on Khobar Towers. Kellyís enlisted people responded again when the decision to close the ALC and realign the base was made. During the last six years, the enlisted members of Team Kelly came together, pulling together the folks from main Kelly, Security Hill, Medina Annex, and East Kelly like never before. They were determined to make the last years of Kelly the best and most productive possible.

They did this by initiating several professional development programs, improving the baseís professional military education (PME) facility and the unaccompanied enlisted personnel dormitories, and emphasizing the concept of "Team Kelly." The ALC spent more than $400,000 to add physical and process improvements to Kelly's Airman Leadership School, which transferred to Lackland AFB on February 12, 2001. Another $4 million went into dormitories on main Kelly and on Security Hill to enhance the quality of life for its young enlisted troops.

Staff Sergeant Susan Robinson

Team Kelly became a reality as its enlisted professionals created a number of programs to make the base the best possible place to live and work. One such program included a three-day course on both main Kelly and Security Hill that ìre-bluedî about 700 staff and technical sergeants who had been away from PME for a long time, the first such course in AFMC. Another was a four-day seminar to give about 800 members selected for promotion to staff sergeant and master sergeant the tools they needed to fulfill their new responsibilities as NCOs and senior NCOs, also a first in AFMC. Kelly's enlisted personnel taught a course for 250 new lieutenants that included a half day devoted to a discussion about enlisted matters. They also offered a two-day course to train 300 civilian supervisors on Air Force personnel policies and regulations they

needed to lead effectively, another first in AFMC. The list of "firsts" in AFMC continued: a five-day first term airmen orientation program that got 350 of Kelly's newest members off to the right start at their first base; Airman Manual training; and a three-day mentoring program, "Teaching Early Airmen Mentorship, to give career guidance to airmen at the three-year point in their first term. Kelly's senior NCOs also started the "Right Decision Program," that gave 275 first- and second-term airmen all the information they needed to make informed decisions about their futures in the Air Force. This initiative and the Kelly AFB Quarterly Retention Leadership Reviews were firsts for the Air Force that were exported throughout the service as part of the Retention Summit recommendations. These programs were the way Team Kelly became a reality as everyone was given an opportunity to participate. Other new initiatives included establishment of the Kelly AFB Junior Enlisted Council for airmen in grades E-1 through E-6, creation of a base promotion ceremony, and establishment of monthly Command Chief Master Sergeant's Leadership Luncheons, as well as developing semiannual wellness day competitions and dormitory and housing spruce up days. These programs helped make Team Kelly a reality as everyone had an opportunity to participate.

That Kelly's enlisted force was dedicated to create an environment where all people at the base could succeed was uncontested. Their success achieved command and Air Force wide recognition. AFMC selected Airman First Class Carlos S. Markham from the 651st Civil Engineering Squadron as its Outstanding Airman of the Year in 1993. Senior Airman Kim Stibbs, 76th Security Forces Squadron, became the AFMC Outstanding Airman of the Year for 1996, and Technical Sergeants Sahron Duke, 76th Medical Group, and Nancy Judge, 76th Mission Support Squadron, won the AFMC NCO of the Year honors in 1997 and 1998, respectively. Two more Kelly NCOs were chosen to represent AFMC as its "best of the best" at the March 2000 Outstanding Airmen and First Sergeants of the Year Award Banquet. Senior Master Sergeant Marc Crandell, Chief of Telecommunications Systems, 76th Communications Squadron, was selected as AFMC Senior NCO of the Year; and Staff Sergeant Susan Robinson, NCO in charge of the SA-ALC Civil/Environmental Law Division, was AFMC NCO of the Year. In fact, Staff Sergeant Robinson went on to become one of the Air Force's 12 Outstanding Airmen of the Year for 2000, a distinct honor recognizing her far-reaching personal and professional accomplishments. Two more representatives from Kelly had a chance to shine again in 2001 as Master Sergeant David Lesieur, flight chief for the 76th Mission Support Squadron Airmen Leadership School, won honors as AFMC Senior NCO of the Year, and Master Sergeant Cathy Johnson, 76th Security Forces Squadron, was selected as the AFMC First Sergeant of the Year. Lesieur went on to become one of the Air Force's 12 Outstanding Airmen of the Year for 2001, and Johnson garnered Air Force First Sergeant of the Year honors. Additionally, Technical Sergeants Edwin Wilson, 690th Computer Systems Squadron, David Anthony, also of the 690th; and Karen Zabel, Air Force Information Warfare Center, won NCO of the Year honors in the Air Intelligence Agency (AIA) for 1998, 1999, and 2000, respectively. With these 11 professionals as role models, Kelly enlisted personnel went on to win over 250 major personal and functional awards at AFMC, AIA, Air Force News Service, and Air Force levels in the 1990s.

TENANTS

Air Force News Agency

The Air Force News Agency (AFNEWS) created and delivered news products and services to keep the American armed forces, their families, and the American public informed during peace and war. It managed and operationally controlled the Air Force Broadcasting Service and its outlets, the Army and Air Force Hometown News Service, and the Air Force News Service. AFNEWS traced its history back to June 1, 1978, when the Air Force Service Information and News Center (later Air Force News Center) activated at Kelly, formed by the merger of several Secretary of the Air Force Public Affairs functions. A year later, the Air Force Hometown News Center moved from Tinker AFB, Oklahoma, to the agency, followed in October 1980 by the Army Hometown News Center, which relocated from Kansas City, Missouri. On October 1, 1980, the Air Force Armed Forces Radio and Television Service (AFRTS) became a separate directorate within the center to assume full operational control of all Air Force owned and operated AFRTS functions. In October 1983, the directorate's name changed to the Air Force Broadcasting Service. The directorate became an Air Force-named unit on May 1, 1988. The unit inactivated in October 1997, and its mission transferred to a directorate in the Air Force News Agency.

The importance of AFNEWS came to the forefront during the various real world contingency operations in which the Air Force had taken part since 1990. In Desert Shield and Desert Storm through the air war over Serbia, AFNEWS personnel set up 24-hour hotlines to give information to the public and deployed Air Force Combat Information Teams to gather print and electronic news reports, feature stories, and imagery on Air Force operations.

In October 1991, AFNEWS broke ground on East Kelly for its new, $4 million headquarters building. Some 160 people located in three separate buildings on main Kelly moved into their modern, 40,000-square-foot facility in May 1994. Since the BRAC commissioners did not specifically direct AFNEWS to realign to Lackland AFB, its leaders pushed hard during initial planning in the summer and fall of 1995 to remain in the new building on East Kelly. Kelly, Lackland, and Greater Kelly Development Corporation officials agreed to this arrangement early on. When the GKDC assumed full responsibility for East Kelly on October 1, 1997, AFNEWS became a tenant to San Antonio's redevelopment authority. Its people continue to keep Air Force members and their families informed about important Air Force programs and policies.

Midwest Region Headquarters of the Defense Commissary Agency

At the end of World War II, each of the military services made its own regulations for commissaries—stores that sold grocery items to its personnel and family members. After the establishment of a separate Air Force in 1948, the major commands set their own commissary operating policies and procedures, with each base managing its own store. This usually proved inefficient and counterproductive with substandard facilities, remote site delivery problems, poor service, and the inability of smaller stores to receive price reductions based upon sales volume. A 1975 Department of Defense study attributed these shortcomings largely to the lack of professional training, standardized procedures, and a centralized organization.

Consequently, the Defense Department established the Air Force Commissary Service in January 1976 to overcome these problems within the Air Force. The headquarters, located on East Kelly, began operating with a small cadre of key personnel in April before officially taking control of all Air Force commissaries on October 1, 1976.

The new organization began building new facilities and modernizing its existing stores. By 1989 over half of the Air Force commissaries were operating from new buildings. State-of-the-art methods of grocery management, scanners, and computerized inventory methods were used to cut costs and streamline operations. The headquarters staff managed the wartime subsistence mission and peacetime operation of commissaries as well as interfaced with local and national vendors to obtain discounts, promotions, and the best prices possible. But the tide of centralization did not stop with just consolidated operations of one service. Congressional budget cutbacks forced the Defense Department to look at centralizing all commissary operations. On October 1, 1991, the Air Force Commissary Service officially consolidated with the commissary functions of the other services to form the new Defense Commissary Agency, headquarterd at Fort Lee, Virginia.

While the Air Force failed to locate the new agency's headquarters on Kelly, the San Antonio location remained important. The former Air Force Commissary Service headquarters building on East Kelly became the Midwest Regional headquarters and included a service center that paid bills and salaries for all commissary operations located from the Mississippi River to Japan. The Midwest Region headquarters also opted to stay in its facility on East Kelly once the BRAC Commission decided to close SA-ALC and realign the base to neighboring Lackland AFB. On October 1, 1997, it became a tenant of the GKDC, but the mission remained the same—providing the best rations available to American service members and their families in war and peace.

Air Intelligence Agency

The Air Intelligence Agency gains, exploits, defends, and attacks information to ensure the United States Air Force maintains superiority in the air, space, and information domains. The agency traced its origins to 1948 and the establishment of the United States Air Force Security Service (USAFSS), which provided cryptologic support for the fledgling Air Force. Several months later, the Army transferred three mobile radio squadrons and a radio security section to the new service. In May 1949, its headquarters moved from Washington, D.C., to Brooks AFB in San Antonio. In 1953 USAFSS moved into its new building on "Security Hill" at Kelly. Five years later USAFSS assumed base support functions at a number of locations throughout the world.

Early in 1967, USAFSS picked up another role, that of a central evaluating agency for all Air Force electronic warfare activities. On October 1, 1978, USAFSS ended 20 years of base management when it transferred responsibility for its last two overseas bases to the theater commands. Three months earlier, it handed responsibility for cryptologic training, located at Goodfellow AFB, Texas, to Air Training Command.

On August 1, 1979, the United States Air Force Security Service changed its name to the Electronic Security Command (ESC), reflecting a new command, control, and communications countermeasure tasking and broader

broader electronic warfare responsibilities. In 1985 ESC picked up another new mission, computer security, with the transfer of the Air Force Computer Security Office from Gunter Air Force Station, Alabama, to Kelly.

Twelve years later, on October 1, 1991, the command was redesignated, becoming the Air Force Intelligence Command when the people and missions of ESC combined with those of the Air Force Foreign Technology

General John P. Jumper, Commander of Air Combat Command, reviews flights of AIA airmen during ceremonies integrating the Air Intelligence Agency into ACC. At General Jumper's left is AIA Colonel Steven Miller, who served as commander of troops for the ceremony.

Division from Wright-Patterson AFB, Ohio; the Air Force Special Activities Center at Fort Belvoir, Virginia; and elements of the Air Force Intelligence Agency in Washington, D.C., to form a single command.

As part of the major reshaping of the Air Force, the Air Force Intelligence Command was redesignated yet again, becoming the Air Intelligence Agency (AIA) on October 1, 1993. The Air Force reorganized its intelligence function again on February 1, 2001, when AIA realigned as a primary subordinate unit under Air Combat Command. The realignment integrated the Air Force's information warfare skills and talents into the normal tactical and operational level of war. Under the reorganization, AIA's 67th Information Operations Wing and the 690th Operations Group at Kelly and the 70th Intelligence Wing at Fort Meade, Maryland, came under the Eighth Air Force, headquartered at Barksdale AFB, Louisiana. AIA's three centers, the National Air Intelligence Center at Wright-Patterson AFB, the Air Force Information Warfare Center at Kelly, and the Air Force Technical Applications Center, an administratively-supported unit at Patrick AFB in Florida, continued to align under AIA headquarters. AIA remained on Security Hill, becoming a tenant organization of Lackland AFB on April 1, 2001. Despite these changes, the men and women of AIA continued to follow their motto, "Freedom through Vigilance," and the support they provide—intelligence, surveillance, and reconnaissance—contributions to that vigilance.

433d Airlift Wing—The Alamo Wing

Fifty years ago, on October 17, 1951, 200 Air Force reservists gathered on Brooks AFB to form the 907th Pilot Training Wing, christened as the "Alamo Wing." Two years later, the 907th inactivated. Its personnel and nickname went to the 8707th Pilot Training Wing, where aircrews flew C-46s, C-45s, AT-6s, and T-28s. In 1955 this wing inactivated, and its personnel were assigned to the newly reactivated 433d Troop Carrier Wing, which flew C-119s. When the runways at Brooks closed for the last time, the Alamo Wing moved across town to its new home at Kelly AFB in 1960.

Beginning in 1966, the 433d replaced its aging C-119s with C-124s. A year later, on July 1, 1967, the 433d became a tactical airlift wing. During the reserve recall during the Pueblo Crisis in 1968, the Alamo Wing was reassigned to the Military Airlift Command. In 1971 the 433d began flying the workhorse of the Air Force, the reliable and versatile C-130. With the C-130, the wing flew humanitarian missions, fought forest fires, and participated in exercises in Greece and Panama.

In 1984 the biggest announcement in the wing's history came out of Washington, D.C.—the Alamo Wing would be the first unit in either the Air Force Reserve or Air National Guard to be assigned the C-5. In keeping with the C-5's global mission, the Alamo Wing was redesignated as the 433d Military Airlift Wing. The first of the huge cargo transports arrived in December 1984 and, appropriately, it was named "The City of San Antonio."

In December 1989, as U.S. forces moved against the Panamanian dictator Manuel Noriega, Alamo Wing reservists provided aeromedical evacuation support and cargo relief during Operation Just Cause. Less than a year later, the Alamo Wing answered the call again as wing personnel were involved in Operation Desert Shield from the beginning, providing airlift support in Southwest Asia. Their greatest sacrifice occurred early in the deployment when a C-5 flown by an Alamo Wing crew crashed during take-off in Germany while transporting supplies to Saudi Arabia. Of the 17 people aboard, 9 crew members and four passengers were killed. Wing personnel also flew in Operations Provide Comfort in northern Iraq, Provide Hope to Russia, and Restore Hope in Somalia.

In the Air Force-wide reorganization that followed the war in Southwest Asia, the Alamo Wing received a new name, becoming the 433d Airlift Wing on February 1, 1992. On April 1, 2001, the area west of Kelly's runway realigned to neighboring Lackland AFB. The 433d's new location was named the Kelly Field Annex.

From a few hundred reservists in 1951, the Alamo Wing now has more than 3,700 dedicated men and women who have proved time and again that they are true to the Air Force Reserve Command motto, "Ready Now!"

149th Fighter Wing

The 149th Fighter Wing began at Brooks Field on October 6, 1947, as the 182d Fighter Squadron. It inherited the history, battle honors, and colors of the 396th Fighter Squadron, which flew missions over Normandy, northern France, Belgium, and Germany's Rhineland before inactivation in 1946.

The 182d Fighter Squadron primarily operated F-51 Mustangs until the Korean War when its pilots learned to fly the F-84 Thunder Jet. As part of the 136th Fighter Wing, the 182d was the first Air National Guard (ANG) squadron to see combat during the Korean War, the first ANG unit to shoot down an enemy MiG-15, and the first unit to prove the concept of aerial refueling during combat. After Korea, the 182d Fighter Squadron returned to flying the F-51 until 1956 when it moved to Kelly AFB, where the longer runways could accommodate the unit's transition to the F-80 Shooting Star. The squadron's hangars and other facilities were dedicated in 1959.

In 1960 the first of several major reorganizations occurred. New squadrons and a headquarters staff were added, and the 182d became part of the 149th Fighter Interceptor Group. The group was later redesignated as the 149th Tactical Fighter Group and then simply as the 149th Fighter Group.

The 149th Fighter Wing began flying F-16s in the 1980s.

During its history, the unit maintained and flew a wide variety of fighter aircraft, including the F-80, F-86 Sabre Jet, F-102 Delta Dagger, F-100 Super Sabre, and the F-4C Phantom. During the 1980s, the 149th became one of the first in the ANG to convert to the F-16 Fighting Falcon.

Over the years, the members of the Texas Air National Guard unit have served in the dual mission for the federal government and the state. In its federal mission, the unit has stayed ready to mobilize as an able fighting force to operate alongside active U.S. military forces. The 149th has participated in major exercises throughout the United States and in such far-away places as Iceland and Turkey. In its state mission, the unit has remained prepared to assist communities with medical support, emergency communications, and search-and-rescue operations. Among its community activities in recent years, the unit has provided space and support for a "second-chance" school and lent regular assistance to a downtown homeless shelter.

During Operations Desert Shield and Desert Storm, 95 members of the 149th were called to active duty. In the Air Force reorganization that followed the Gulf War, the group was redesignated the 149th Fighter Wing and became part of the new Air Combat Command. In 1999 the wing transferred to Air Education and Training Command and changed its primary mission to training F-16 pilots from the active Air Force and Air Force Reserve along with ANG pilots. This mission change required a change in aircraft. The fighter squadron, which had replaced its F-16A models for C models earlier in the decade, added two-seater F-16Ds to its inventory. On April 1, 2001, the wing became a tenant of Lackland AFB.

Commanders of the San Antonio Air Logistics Center

and its Predecessors

1918 through 2001

Maj. George H. Brett
19 Dec 1918 - 21 Feb 1919

Maj. William H. Garrison, Jr.
21 Feb 1919 - 24 Jul 1922

Maj. Frank D. Lackland
24 Jul 1922 - 18 Jun 1926

Maj. J. H. Pirie
2 Jul 1926 - 19 Mar 1927

Lt. Col. James A. Mars
2 Jun 1927 - 12 Jul 1929

Maj. Augustine Warner Robins
12 Jul 1929 - 3 Nov 1931

Lt. Col. A. G. Fisher
3 Nov 1931 - 15 Jun 1934

Col. John H. Howard
